

UNFCCC Technical workshop on ecosystem-based approaches for adaptation to climate change

The Brazilian national adaptation planning process

Challenges of Eba for NAP (National Adaptation Plan) formulation process:

- Eba is project and locally based. Its results haven't been scaled up into strategic and overarching national planning.
- Eba lacks on indicators to measure its real effectiveness on resilience.
- Eba does not assess the economics impacts of ecosystems that are under risk nor of those that have been made resilient.
- Eba feasibility – if applied in the national level, would it require a full survey of ecosystems that are impacted from climate change in the long term (up to 2100)?
