Mexico's experience to use the National Forest Inventory to improve GHG reporting

**Ben de Jong, Marcela Olgúin, Fabiola Rojas,
Vanessa Maldonado, Fernando Paz**

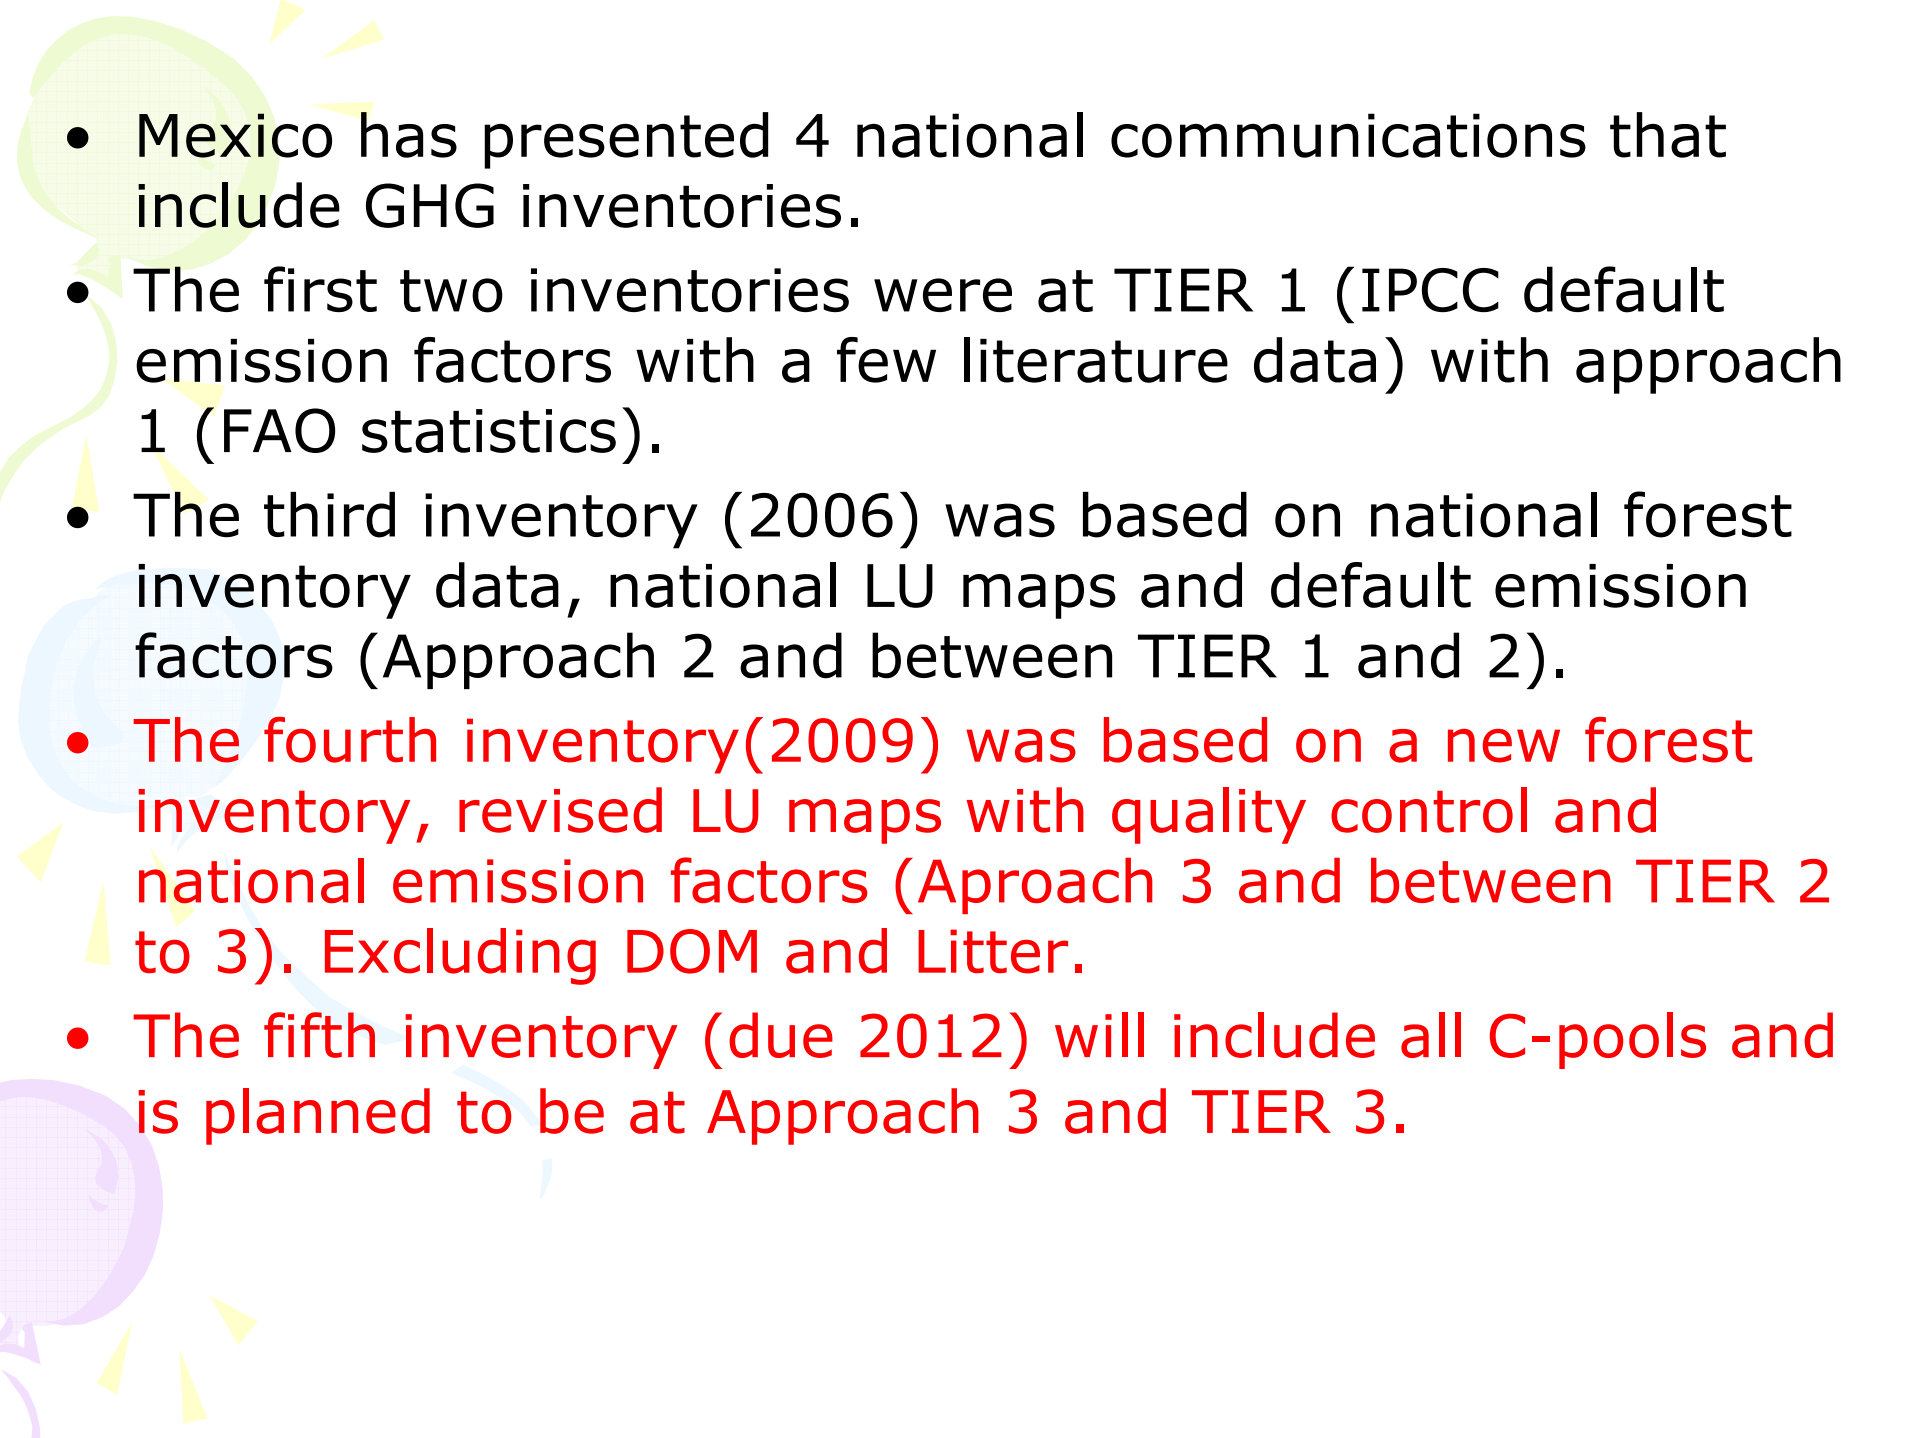

Elements

- Introduction
- National Forest Inventory and biomass estimation
- Community monitoring
- Satellite monitoring system

Introduction

Applying IPCC Good Practice Guidance and Guidelines (LULUCF, AFOLU):

Approaches (Area change)	Tiers (C pool change)
1. Basic land use data -country statistics, i.e. FAO	1. IPCC default values (i.e. biomass in forest types, carbon fraction etc.)
2. Surveys of land change: i.e. national statistics on land use transitions	2. Country specific data (i.e. from field surveys, inventory, permanent plots)
3. Spatially explicit data: a. From remote sensing b. National inventory	3. National inventory of C stocks in different pools and assessment of any change in carbon pools or national methodologies which are fulfilling IPCC tier 3 requirements

- 
- Mexico has presented 4 national communications that include GHG inventories.
 - The first two inventories were at TIER 1 (IPCC default emission factors with a few literature data) with approach 1 (FAO statistics).
 - The third inventory (2006) was based on national forest inventory data, national LU maps and default emission factors (Approach 2 and between TIER 1 and 2).
 - The fourth inventory(2009) was based on a new forest inventory, revised LU maps with quality control and national emission factors (Aproach 3 and between TIER 2 to 3). Excluding DOM and Litter.
 - The fifth inventory (due 2012) will include all C-pools and is planned to be at Approach 3 and TIER 3.

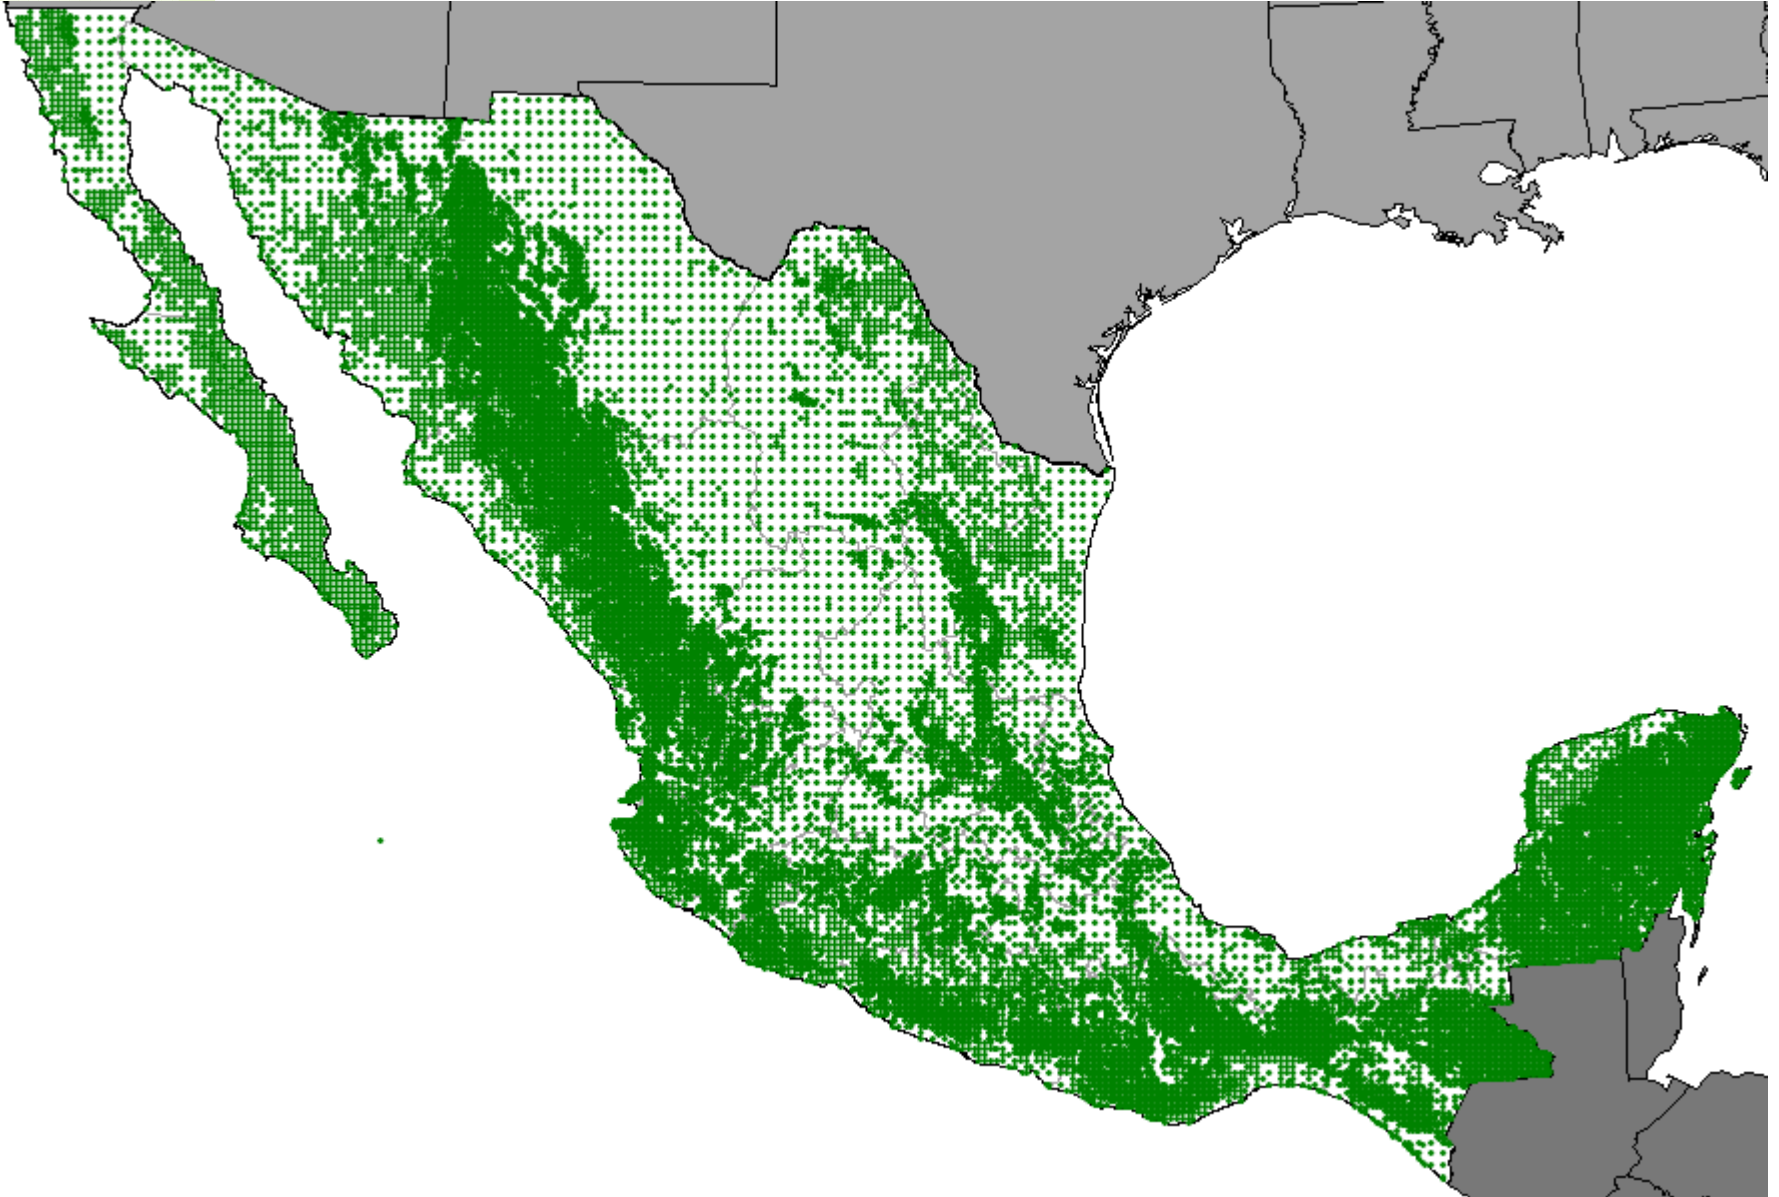

INFyS: 2004-2007 Design

4 Sites of 400 m², in total the plot represent 1 ha.

Data collected: trees, shrubs and woody regrowth, dead standing trees and stumps

**Aprox 25,000 plots established, of which 23,000 measured
20% re-measured every year**

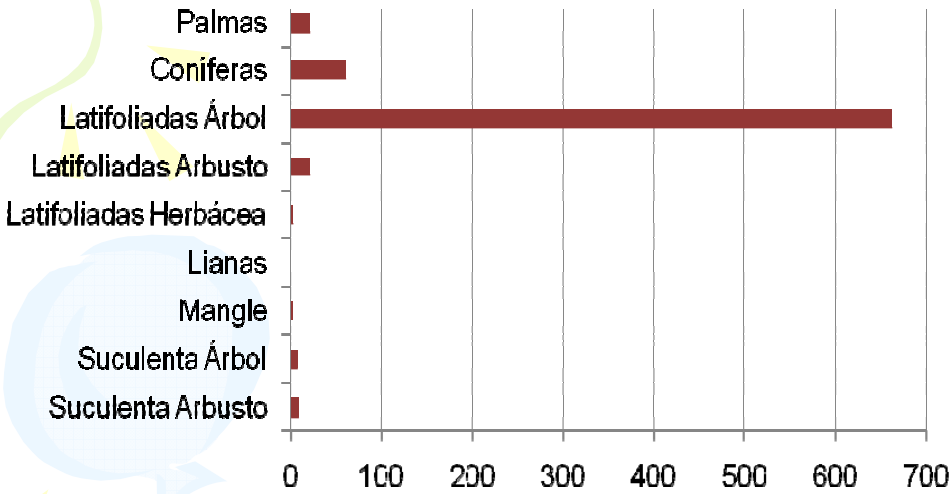

Number of species reported in the Nat Forest Inventory in each life form

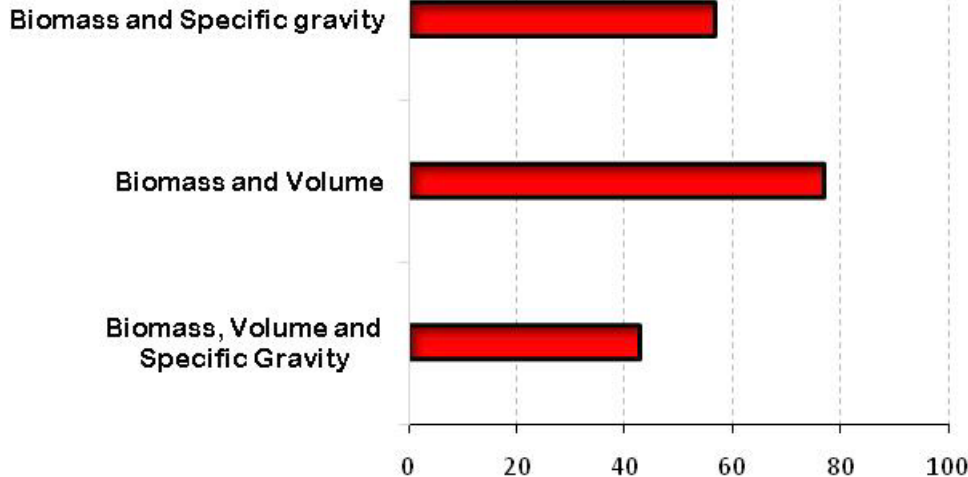

Alometric equations to convert inventory data to volume or biomass

Volume

Biomass

Number of species with more than one attribute

Additionally:

4 Generic equations for trees according to ecosystem (Tropical humid, tropical dry, cloud forest, scrub dessert)

How to stratify the forests?

LU-classification system applied in Mexico (as reported to FAO and UNFCCC)

Forest

Coniferous Forest

Oak forest

Pine Forest

Pine-Oak Forest

Oak Forest

Oak-Pine Forest

Intact Forest

Secondary tree dominated veg

Secondary shrub dominated veg

IPCC reporting

Pine forests contain in general a combination of 2-3 Pine species, out of 70 species

Oak forests contain 2-4 Oak species out of 150 species

Av Biomass and 95% CI

Tier 1 and 2

Average biomass, based on 10,300 plots.
 Average range from 31 to 237 Mg/ha
 4 to 113 %

95% CI ranges from

Av. Biomass of Oak forest in each state and 95% CI (Mg/ha)

Tier 2 and 3

Ajustments in the inventory since 2009

all pools to be measured, all according to IPCC

- Each tree marked individually
- Field measurements of dead fallen material (also important to determine fuel load for fire emissions)
- Litter (2 layers) and soil samples (0-30, 31-60 cm) for laboratory analysis (Weight, relative density and C-content)

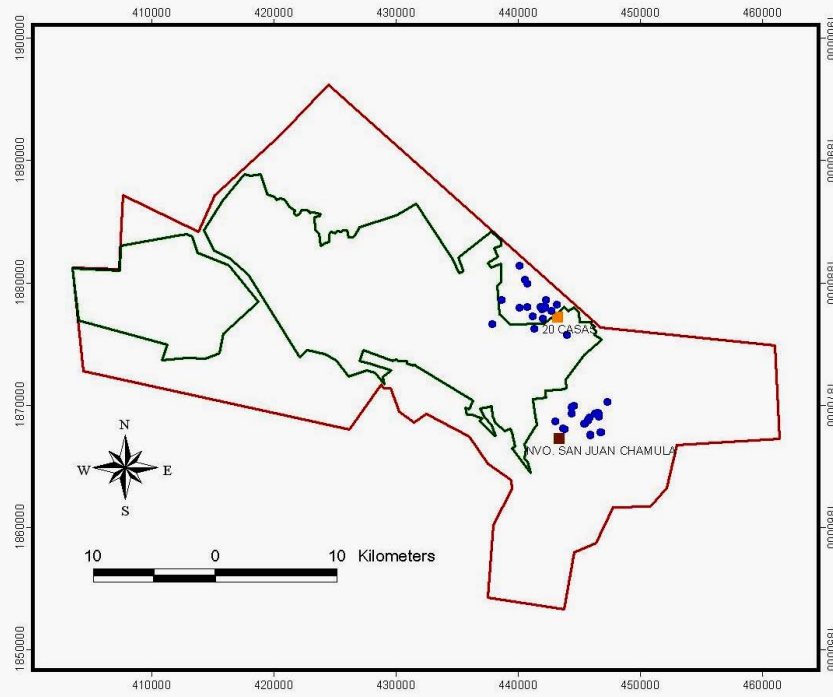

Ajustments in the inventory since 2010

- Sampling of dead fallen material for laboratory analysis (relative density and C-content).

Improvements:

- Measurements of all pools in all forest types
- Direct relationship between biomass and soil carbon
- Estimate of labile SOC fraction
- Fuel load in each forest type and ecoregion
