

Abstract for the Seminar of Government Experts

May 16-17, 2005

Bonn, Germany

Submitted by the People's Republic of China

China is vulnerable to climate change. The Chinese Government attaches great importance to climate change and has taken many measures to address climate change. These measures include adjustment of industry and energy structure, promotion of energy efficiency, energy saving, development of renewables, increasing forest carbon sinks, etc. However, China is a developing country with low per capita income. China's development, urbanization, growth of population and high proportion of coal in the energy mix will unavoidably make its efforts to reduce/limit GHG emissions more difficult without efficient international technological cooperation. China urges the international community to engage in practical technological cooperation in the future so as to combat climate change effectively and promote global sustainable development.
