

## **Global CO<sub>2</sub> reduction potential: Approach from energy efficiency**

**Mr. Toshiyuki Shirai, Japan**

Energy efficiency is a key to substantial CO<sub>2</sub> reduction and thus important policy target for all countries. Sectoral approach is effective to improve energy efficiency as well as to figure out global CO<sub>2</sub> reduction potential. In realizing the potential, transfer for BAT as well as steady R&D activity from the long-term perspective is necessary. Not only the bilateral but also the multilateral approach such as shown in APP is an effective approach to realize global CO<sub>2</sub> reduction through energy efficiency improvement.
