DESCRIPTION

The main objective of this manual, which is connected to Chile's National Climate Change Action Plan, is to reduce vulnerability and increase the capacity of Chile's fisheries and aquaculture sector to adapt to climate change.

It gathers the pedagogical material deployed in this experience, which can be complemented with the Learning Facilitator's Guide.

Both aim to be a concrete contribution to the process of adaptation of coastal communities to the new climate scenario, not only in the Chilean context, but also in the rest of Latin America, the Caribbean and other regions.
