

*Identifying
climate change
adaptation
options for
agriculture and
food security*

Mark Howden and many colleagues
ANU Climate Change Institute
Vice Chair, IPCC Working Group II

Who identifies adaptations ?

- Climate change will likely impact everyone, at every scale, sometimes a little, sometimes a lot
 - farmer, fisher, forester
 - village, region, nation
 - value chains (pre-farm, farm and post-farm)
 - policymakers and institutions
- Means that identification of effective climate adaptations is **everyone's** business
- Increasingly so over time

What adaptations to select from ?

- Huge diversity
 - on farm and off farm
 - technical and managerial
 - tactical and strategic
 - incremental to transformational
 - institutional
 - gender-based
 - traditional and scientific
 - etc
- Highly contextual - values
- Change in knowledge

How to select between these ?

- Technical options are often useful but not sufficient
 - focus on strategic skills and decisions
- Need a whole-of-system approach
- Pathway to adoption and impact
- Principles for this have been known for a long time but the practice remains difficult
- Often there has been resort to data and information systems to support change management
- These rarely work

The decision-support landscape

Towards knowledge-sharing

- Data and information systems often address single, simple, technical and short-term adaptations to existing systems
- Instead of the more complex, compound, highly contextual, strategic, tacit, socially and institutionally-mediated changes that often characterise real-world change processes
- Trust
- Move from focus on data/information to knowledge-sharing
- Policy-oriented platform to share successes, failures and needs with person-to-person elements
- Aspiration: Wisdom-sharing platform ?

Identifying and learning the best options

- Because adaptation is highly contextual and diverse, someone, somewhere is likely to have tried many of the existing adaptation options
- Sharing that diverse experience – what works, what does not and why ?
 - important as increased variability will often require flexibility and diversification
- Aim to accelerate learning, scaling up and scaling out
- Social learning – much more than just information
 - trusted, relevant, credible and legitimate
 - social networks impact on adaptation

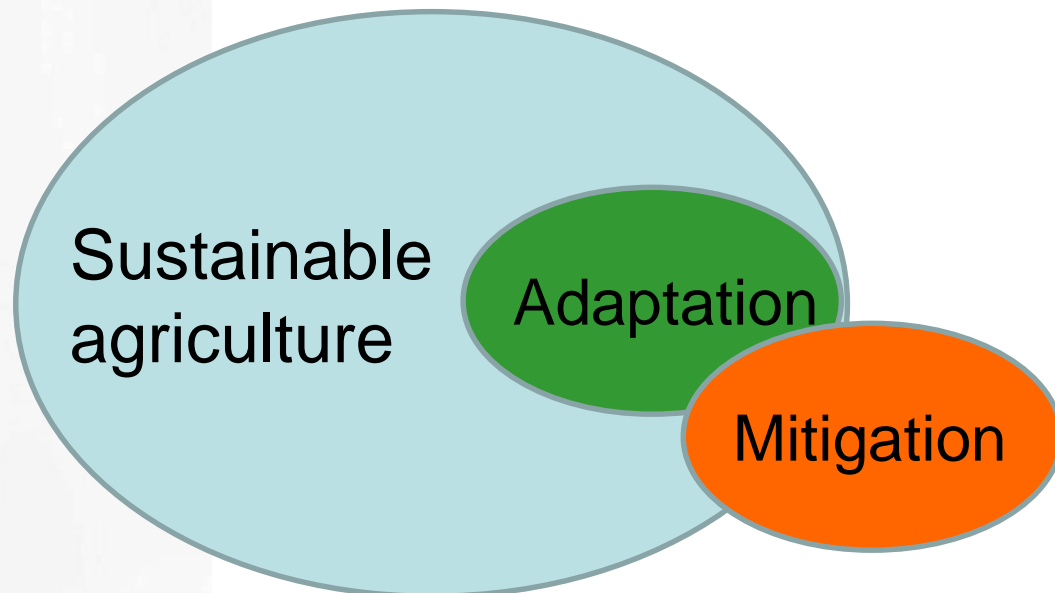

Co-producing and selecting options

- Practitioner knowledge sharing
- Pooling knowledge
 - ‘scientific’ and indigenous or traditional knowledge
 - gender-specific
 - cross-scale, cross-domain
- Expands the range of options and builds adaptive capacity
- Ownership, empowerment and implementation
- Rules-of-thumb and contextual transferability
- Systematic monitoring and evaluation

Adaptation, mitigation and sustainable agriculture

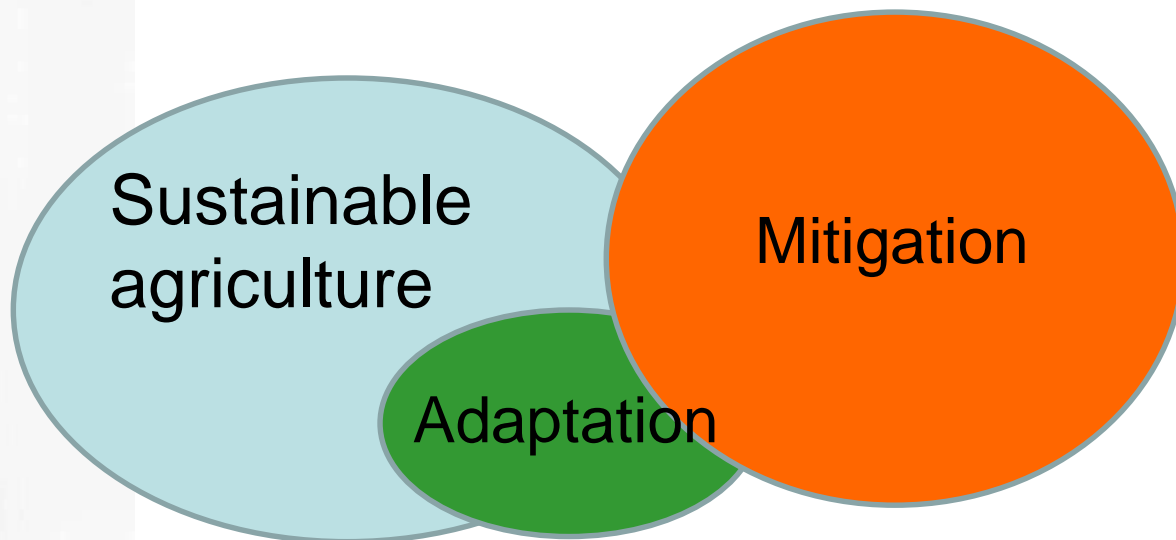

- Prioritisation of adaptation and mitigation
- Depends on how you look at it – values, variability
- Clear interactions, co-benefits

Adaptation, mitigation and sustainable agriculture

- Prioritisation of adaptation and mitigation
- Depends on how you look at it – values, variability
- Clear interactions, co-benefits

Summary

- Adaptation is important – now and in the future
 - needs to be integrated with mitigation, broader food security and co-benefits
- Selection of adaptations can happen at many points in food systems
- Technical adaptations of existing systems are important but not sufficient – strategic approach
- Effective, shared learning processes can pool knowledge and contextualize action locally
- We can identify practical criteria and approaches now

Thank you
