Executive summary

ES.1. Background information on greenhouse gas inventories

The European Community, as a Party to the United Nations Framework Convention on Climate Change (UNFCCC), reports annually on greenhouse gas (GHG) inventories within the area covered by its Member States.

The legal basis for the compilation of the EC inventory is Council Decision 99/296/EC amending Council Decision 93/389/EC for a monitoring mechanism of Community CO₂ and other greenhouse gas emissions¹. The purpose of this decision is to monitor all anthropogenic GHG emissions not controlled by the Montreal Protocol in the Member States and to evaluate progress towards meeting GHG reduction commitments under the UNFCCC and the Kyoto Protocol.

The EC GHG inventory is compiled on the basis of the inventories of the 15 EC Member States. It is the direct sum of the 15 national inventories, except for the reference approach for CO₂ from fossil fuels developed by the Intergovernmental Panel on Climate Change (IPCC). The main institutions involved in the compilation of the EC GHG inventory are the Member States, the European Commission - DG Environment (DG ENV), the European Environment Agency (EEA) and its European Topic Centre on Air and Climate Change (ETC-ACC), Eurostat, and the Joint Research Centre (JRC).

The process of compilation of the EC GHG inventory is as follows: Member States submit their annual GHG inventories by 31 December each year to the European Commission (DG ENV). Then, EEA/ETC-ACC, Eurostat and JRC perform initial checks on the submitted data. On 1 March, the draft EC GHG inventory and inventory report are circulated to Member States for reviewing and commenting. Member States check their national data and information used in the EC inventory report, send updates, if necessary, and review the EC inventory report itself by 1 April. The final EC GHG inventory and inventory report are prepared by EEA/ETC-ACC by 15 April for submission by the European Commission to the UNFCCC secretariat.

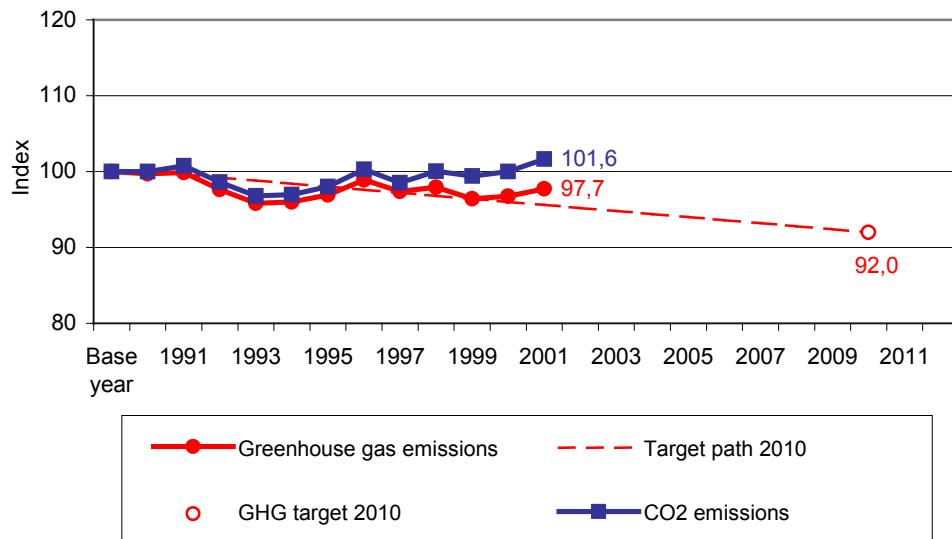

ES.2. Summary of emission and removal related trends

Total GHG emissions without land-use change and forestry (LUCF) in the EC decreased between the base year and 2001 by 95.735 Gg (-2,3 %). In the Kyoto Protocol, the EC agreed to reduce its GHG emissions by 8 % by 2008-2012, from 1990 levels. Assuming a linear target path from 1990 to 2010, total EC GHG emissions were 2,1 index points above this target path in 2001 (see Figure ES1).

CO₂ is by far the most important GHG, accounting for 82 % of total EC emissions in 2001. In 2001, EC CO₂ emissions without LUCF were 1,6 % above 1990 levels.

¹ OJ L 117, 5.5.1999, p. 35

Figure ES1: EC GHG emissions 1990-2001 compared with target for 2008-2012 (excl LUCF)

Note (1): The linear target path is not intended as an approximation of past and future emission trends. It provides a measure of how close the EC emissions in 2001 are to a linear path of emissions reductions from 1990 to the Kyoto target for 2008-2012, assuming that only domestic measures will be used. Therefore, it does not deliver a measure of (possible) compliance of the EC with its GHG targets in 2008-2012, but aims at evaluating overall EC GHG emissions in 2001. The unit is index points with 1990 emissions being 100.

Note (2): GHG emission data for the EC as a whole do not include emissions and removals from LUCF. In addition, no adjustments for temperature variations or electricity trade are considered.

Note (3): For fluorinated gases the base year 1995 was used for all Member States, which is in line with the base year indicated so far by most MS individually.

Table ES1 gives an overview of the main trends in EC GHG emissions and removals for 1990-2001. In 2001 CO₂ emissions made up 82 % of the total GHG emissions in the EC. This was an increase of 54.417 Gg (1,6 %) compared to 1990. This increase was compensated by decreases in CH₄ and N₂O emissions in the same period: CH₄ decreased by 84.557 Gg (-20,4 %) and N₂O decreased by 64.452 Gg (-15,8 %). Fluorinated gases showed opposing trends. While HFC and SF₆ emissions increased by 17.715 Gg (69,0 %) and 1.226 Gg (14,7 %), PFC emissions decreased by 7.875 Gg (-58,8 %).

Table ES1: Overview of EC GHG emissions and removals from 1990 to 2001 in CO₂ equivalents (Gg)

GREENHOUSE GAS EMISSIONS	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001

ES.3. Overview of source and sink category emission estimates and trends

Table ES2 gives an overview of EC GHG emissions in the main source categories for 1990-2001. The emissions from the largest source category ‘Energy’ with an 81 % share of the total emissions, increased by 34.170 (1,0 %). This increase was offset by decreases in the second-, third- and fourth-largest categories: emissions from ‘Agriculture’ decreased by 33.543 Gg (-7,7 %), emissions from ‘Industrial Processes’ by 50.861 Gg (-16,8 %), and emissions from ‘Waste’ by 32.498 Gg (-24,1 %).

Table ES2: Overview of EC GHG emissions in the main source categories 1990 to 2001 in CO₂ equivalents (Gg)

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001
	CO ₂ equivalent (Gg)											
1. Energy	3.309.531	3.343.140	3.273.632	3.213.816	3.206.413	3.236.580	3.315.931	3.249.818	3.299.503	3.274.547	3.288.521	3.343.702

3. Solvent and Other Product Use	9.559	9.469	9.258	8.860	8.827	8.857	8.872	8.939	8.974	8.936	9.039	8.771
4. Agriculture	433.768	423.311	412.802	407.912	409.350	408.989	412.257	412.354	410.496	410.097	406.816	400.225
5. Land-Use Change and Forestry	-184.060	-208.678	-194.237	-205.090	-192.753	-183.758	-192.462	-192.506	-182.930	-191.612	-172.386	-195.652
6. Waste	134.998	131.282	125.080	121.631	120.452	118.728	117.210	113.134	109.172	106.473	104.392	102.501
7. Other	1.865	1.835	1.828	1.776	1.918	1.937	1.929	1.778	1.946	1.978	1.954	1.914

Table ES3 gives an overview of Member States contribution to the EC GHG emissions for 1990-2001. The largest emitter with a 24,2 % share of the total EC emissions in the year 2001 was Germany with 993.505 Gg and the smallest with a 0,15 % share was Luxembourg with 6.077 Gg.

Germany reduced its emissions significantly (-18 %) between 1990 and 2001, although the emissions increased again between 2000 and 2001 (1,2 %). Similarly, the second-largest emitter, the United Kingdom reduced its emissions by 12 % between 1990 and 2001, though they increased between 2000 and 2001 by 1,3 %. The third-largest emitter, France, stabilised its 2001 emissions at the level of 1990, despite a 0,5 % increase compared to 2000. The smallest emitter Luxembourg decreased its emissions continuously from 1990 to 2001; the overall reduction from the 1990 level was 44 %.

Table ES3: Overview of MS contribution to EC GHG emissions excluding LUCF from 1990 to 2001 in CO₂ equivalents (Gg)

Member State	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001

ES.4. Information on indirect GHG and SO₂ emissions

CO, NO_x, NMVOC and SO₂ emissions have to be reported to the UNFCCC secretariat because they influence climate change indirectly: CO, NO_x and NMVOC are precursor substances for ozone which itself is a greenhouse gas. Sulphur emissions produce microscopic particles (aerosols) that can reflect sunlight back out into space and also affect cloud formation. Table ES4 shows the total indirect GHG and SO₂ emissions in the EC between 1990-2001. All emissions were reduced significantly from the 1990 levels: the largest reduction was achieved for SO₂ (-63,6 %) followed by CO (-40,2 %), NMVOC (-29,4 %) and NO_x (-25,8 %).

Table ES4: Overview of EC indirect GHG emissions 1990 to 2001 in Gg

GREENHOUSE GAS EMISSIONS	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001

Chapter 1: Introduction to the EC GHG inventory

This report is the annual submission of the European Community (EC) to the United Nations Framework Convention on Climate Change (UNFCCC). It presents the greenhouse gas (GHG) inventory of the EC, the process and the methods used for the compilation of the EC inventory as well as GHG inventory data of the individual EC Member States for the years 1990-2001. The GHG inventory data of the EC MS are the basis of the EC GHG inventory. The data published in this report are also the basis of the progress evaluation report of the European Commission (due in October 2003), required under Council Decision 99/296/EC for a monitoring mechanism of Community CO₂ and other greenhouse gas emissions.

This report aims to present transparent information on the process and methods used for compiling the EC GHG inventory. It addresses the relevant aspects at EC level, but does not describe particular sectoral methodologies of the MS GHG inventories. Detailed information on methodologies used by the MS is available in the national MS inventory reports, submitted separately to the UNFCCC secretariat. However, several chapters in this report compile information provided by the MS, where additional insights can be gained. In many cases this MS information is presented in summary overview tables.

The EC GHG inventory has been compiled according to Council Decision 99/296/EC for a monitoring mechanism of Community CO₂ and other greenhouse gas emissions² and is based on data delivered by the Member States before 4 April 2003. The EC GHG inventory is the direct sum of the 15 national inventories, except for the IPCC reference approach for CO₂ from fossil fuels. Since the data are revised and updated for all years, they replace EC data previously published, in particular, in the 2002 submission by the European Commission to the UNFCCC Secretariat *Annual European Community Greenhouse Gas Inventory and Inventory Report 1990-2000* (EEA, 2002a) and in the report *Greenhouse gas emission trends in Europe, 1990-2000* (EEA, 2002b).

1.1. Background information on GHG gas inventories and climate change

The annual EC GHG inventory is required for two purposes:

First, the EC, as the only regional economic integration organisation having joined the United Nations Framework Convention on Climate Change (UNFCCC) as a Party, has to report annually on GHG inventories within the area covered by its Member States (MS).

Second, under the Monitoring Mechanism, the European Commission has to assess annually whether the actual and projected progress of MS is sufficient to ensure fulfilment of the EC's commitments under the UNFCCC and the Kyoto Protocol. For this purpose, the Commission has to prepare a progress evaluation report, which has to be forwarded to the European Parliament and the Council by October each year. The annual EC inventory is an important element for the evaluation of actual progress.

The legal basis for the compilation of the EC inventory is Council Decision 99/296/EC amending Council Decision 93/389/EC for a monitoring mechanism of Community CO₂ and other greenhouse gas emissions. The purpose of this decision is to monitor all anthropogenic GHG emissions not controlled by the Montreal Protocol in the EC MS and to evaluate

² OJ L 117, 5.5.1999, p. 35

progress towards meeting GHG reduction commitments under the UNFCCC and the Kyoto Protocol.

Under the provisions of Art 3.2 of Council Decision 99/296/EC, the MS shall report to the Commission each year, not later than 31 December:

- their anthropogenic CO₂ emissions by sources and removals by sinks for the previous calendar year;
- final national inventory data on emissions by sources and removals by sinks for the other GHG for the previous year but one and provisional emission data (inventories) for the previous year.

Other GHG include the five other Kyoto Protocol GHG: methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulphur hexafluoride (SF₆). In addition, annual information on emissions of the following gases shall be provided: carbon monoxide (CO), nitrogen oxides (NO_x), non methane volatile organic compounds (NMVOCs) and sulphur oxides, in line with the reporting requirements under the UNFCCC.

The reporting requirements for the MS under Council Decision 99/296/EC are elaborated in Guidelines under this Decision, in particular "Part 1: Guidelines for Member States and EC annual inventories" (European Commission, 2000). According to the Decision and these Guidelines the reporting requirements are exactly the same as for the UNFCCC, regarding content and format. The EC and its MS use the *UNFCCC guidelines on reporting and review* (document FCCC/CP/1999/7), and prepare inventory information in the Common Reporting Format (CRF) and the "National Inventory Report" that contains background information.

In accordance with UNFCCC guidelines, the EC and its MS use the IPCC "Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories" (IPCC, 2000), which is consistent with the "Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories" (IPCC, 1997). The use of this report by countries is expected to lead to higher quality inventories and more reliable estimates of the magnitude of absolute and trend uncertainties in reported GHG inventories.

1.2. A description of the institutional arrangements for inventory preparation

The main institutions involved in the compilation of the EC GHG inventory are the EC MS, the European Commission - DG Environment (DG ENV), the European Environment Agency (EEA) and its European Topic Centre on Air and Climate Change (ETC-ACC), Eurostat, and the Joint Research Centre (JRC). Table 1 shows the main institutions and persons involved in the compilation and submission of the EC inventory.

1.2.1. The EC Member States

All EC MS are Parties to the UNFCCC. Therefore, all MS have to prepare individual GHG inventories in accordance with UNFCCC reporting guidelines and to submit those inventories to the Commission by 31 December every year.

Apart from submitting their national GHG inventories and inventory reports the MS take part in the reviewing and commenting phase of the draft EC inventory report, which is sent to the

MS by 1 March each year. The purpose of circulating the draft EC inventory report is to improve the quality of the EC inventory. The MS check their national data and information used in the EC inventory report and send updates, if necessary. In addition, they comment on the general aspects of the EC inventory report.

The MS also take part in the Monitoring Committee established under Council Decision 99/296/EC. The purpose of the Monitoring Committee is to assist the European Commission in its tasks under Council Decision 99/296/EC.

1.2.2. The European Commission, Directorate-General Environment (DG ENV)

The European Commission, Directorate-General Environment (DG ENV) in consultation with the EC MS has the overall responsibility for the EC inventory. The European Commission is the official receiver of the MS national inventories and inventory reports under Council Decision 99/296/EC and the official supplier of the EC inventory and inventory report to the UNFCCC secretariat. In the actual compilation of the EC inventory and inventory report, DG ENV is assisted by the European Environment Agency (EEA) including its European Topic Centre on Air and Climate Change (ETC-ACC) and by Eurostat and the Joint Research Centre (JRC).

The consultation between DG ENV and the MS takes place in the Monitoring Committee (established under Article 8 of Council Decision 99/296/EC). The Monitoring Committee is composed of the representatives of the MS and chaired by the representative of the Commission (DG ENV). Procedures within the Committee for decision-making, adoption of measures and voting are also outlined in Council Decision 99/296/EC. In order to facilitate decision making in the Monitoring Committee, three working groups have been established: Working Group 1 “Annual inventories”, Working Group 2 “Assessment of progress (effect of policies and measures, projections)” and Working Group 3 “Emission trading”.

The objectives and tasks of Working Group 1 under the Monitoring Mechanism Committee include:

- The promotion of the timely delivery of national annual GHG inventories as required under the Monitoring Mechanism,
- The improvement of the quality of GHG inventories on all relevant aspects (transparency, consistency, comparability, completeness, accuracy and use of good practices),
- The exchange of practical experience on inventory preparation, on all quality aspects and on the use of national methodologies for GHG estimation,
- The evaluation of the current organisational aspects of the preparation process of the EC inventory and the preparation of proposals for improvements where needed.

1.2.3. The European Environment Agency (EEA)

The European Environment Agency (EEA) assists the Commission in the compilation of the annual EC inventory through the work of the European Topic Centre on Air and Climate Change (ETC-ACC). The activities of the EEA/ETC-ACC include:

- Initial checks of MS submissions in co-operation with Eurostat, and JRC, up to 1 March and compilation of results from initial checks (status reports, consistency and completeness reports);
- Consultation with MS in order to clarify data and other information provided;

- Preparation and circulation of the draft EC inventory and inventory report by 1 March based on MS submissions;
- Preparation of the final EC inventory and inventory report by 15 April (to be submitted by the Commission to the UNFCCC secretariat);
- Assisting MS in their reporting of GHG inventories by means of supplying software tools.

The tasks of the EEA and the ETC-ACC are facilitated by the European Environmental Information and Observation Network (EIONET), which consists of the EEA as central node (supported by European Topic Centres) and national institutions in the EEA member countries that supply and/or analyse national data on the environment (see <http://eionet.eea.eu.int/>).

1.2.4. The European Topic Centre on Air and Climate Change (ETC-ACC)

The European Topic Centre on Air and Climate Change (ETC-ACC) was established by a contract between the lead organisation National Institute of Public Health and the Environment - RIVM (The Netherlands) and EEA in March 2001. The ETC-ACC involves 13 organisations and institutions in nine European countries. The technical annex for the 2003 work plan for the ETC-ACC and an implementation plan specify the specific tasks of the ETC-ACC partner organisations with regard to the preparation of the EC inventory. The Federal Environment Agency Austria (UBA Vienna) is the task leader for the compilation of the EC annual inventory in the ETC-ACC, including all tasks mentioned above.

The EEA/ETC-ACC provides software tools for MS to compile national GHG inventories and to convert their national inventory from CORINAIR-SNAP source category codes into the required CRF source categories. The main software tools are CollectER, for compiling and updating national emission inventories, and ReportER, for reporting the emissions in the required format, e.g. CRF. In addition, separate software tools are available to prepare estimates of emissions from agriculture and road transport. These tools are being used by several EC MS. The EEA/ETC-ACC adapts the tools regularly to latest changes in reporting requirements. The tools are available at <http://etc-acc.eionet.eu.int/>.

1.2.5. Eurostat

Based on Eurostat energy balance data, Eurostat compiles annually by 31 March estimates of the EC CO₂ emissions from fossil fuels using the IPCC reference approach. Eurostat compares these estimates with national estimates of CO₂ emissions from fossil fuels prepared by MS and provides information summarising and explaining these differences. In order to improve the consistency of MS and Eurostat energy data, a project on harmonisation of energy balances has started between Eurostat and national statistical offices. In addition, Eurostat is leading an EU project aimed at improving estimates of GHG emissions from international aviation.

1.2.6. Joint Research Centre (JRC)

The Joint Research Centre (JRC) assists in the improvement of methodologies for the LULUCF sector. It does so (1) by intercomparing methodologies used by the MS for estimating emissions and removals with a focus on LULUCF and (2) by providing EU-wide estimates with various models/methods for emissions and removals with a focus on LULUCF (including inverse modelling using measurement of ambient air concentrations of GHGs). In addition, the JRC is leading a project for improving the methodologies used for estimating GHG emissions from agriculture.

1.3. A description of the process of inventory preparation

The annual process of compilation of the EC inventory is summarised in Table 2. The EC MS should submit their annual GHG inventory by 31 December each year to the European Commission (DG ENV). Then, EEA/ETC-ACC, Eurostat and JRC perform initial checks of the submitted data up to 1 March. ETC-ACC transfers the nationally submitted data from the CRF (Common Reporting Format) tables into spreadsheets. From these spreadsheets the data are transferred into the EC CRF tables and into the ETC-ACC database.

Table 2: Annual process of submission and review of MS inventories and compilation of the EC inventory¹⁾

Element	Who	When	What
1. Submission of annual inventory by MS	Member States	31 December annually	Anthropogenic CO ₂ emissions and CO ₂ removals by sinks, for the year n-1 Emissions by source and removals by sinks of the other GHG; Final data for the year n-2 and provisional data for the year n-1 ²⁾
2. Initial check of MS submissions	European Commission (DG ENV, Eurostat, JRC), assisted by EEA/ETC-ACC	up to 1 March	Initial checks (by EEA/ETC-ACC) Comparison of energy data in MS IPCC Reference Approach with Eurostat energy data (by Eurostat and MS) and comparison of MS and JRC's LULUCF inventory estimates
3. Compilation and circulation of draft EC inventory and inventory report	European Commission (DG ENV), assisted by EEA/ETC-ACC	1 March	Draft EC inventory (by EEA), based on MS inventories and additional information where needed Circulation of the draft EC inventory on 1 March
4. Submission of updated or additional data by MS	Member States	up to 1 April	Updated or additional data submitted by MS ³⁾
5. Final annual EC inventory	European Commission (DG ENV), assisted by EEA/ETC-ACC	15 April	Submission of the final annual EC inventory to UNFCCC. This inventory will also be used to evaluate progress as part of the Monitoring Mechanism
6. Additional review of MS submissions and EC inventory	European Commission (DG ENV, Eurostat, JRC), assisted by EEA/ETC-ACC	June to December	Additional review aimed at improving the next annual MS and EC inventories In November Eurostat makes available to MS energy balance data (1990 to inventory year)

1) In accordance with Council Decision 1999/296/EC

2) In accordance with Art. 3(1) and 3(2) of Council Decision 1999/296/EC

3) Preferably updating is limited to the following situations: to remove major inconsistencies, to fill major gaps or to provide essential additional information. Documentation should be included describing which data are updated or are additional, compared to the submission of 31 December.

On 1 March, the draft EC GHG inventory and inventory report are circulated to the EC MS for reviewing and commenting. The MS check their national data and information used in the EC inventory report and send updates, if necessary, and review the EC inventory report by 1 April. This procedure should assure the timely submission of the EC GHG inventory and inventory report to the UNFCCC secretariat and it should guarantee that the EC submission to the UNFCCC secretariat is consistent with the MS UNFCCC submissions.

The final EC GHG inventory and inventory report is prepared by EEA/ETC-ACC by 15 April for submission to the UNFCCC secretariat. In late April the inventory and the inventory report are published on the EEA web site (<http://www.eea.eu.int>) and the data are made available through the EEA data warehouse (<http://dataservice.eea.eu.int/dataservice>). In addition, the EC inventory report is published by EEA as a printed report, with a CD-ROM including the data.

1.4. General description of methodologies and data sources used

The inventory is compiled in accordance with the recommendations for inventories set out in the UNFCCC *Guidelines for the Preparation of National Communications by Parties included in Annex 1 to the Convention, Part 1: UNFCCC Reporting Guidelines on Annual Inventories*, to the extent possible⁴. In addition, the *Revised IPCC 1996 Guidelines for National Greenhouse Gas Inventories* have been applied and also the *IPCC Good Practice Guidance*, where appropriate and feasible. At EC level, Council Decision 99/296/EC and the guidelines thereunder have been used for the compilation of the EC GHG inventory.

The EC greenhouse gas inventory is compiled on basis of the inventories of the 15 EC Member States. The reference approach is calculated for the EC on basis of Eurostat energy data (see Chapter 3.5) and the key source analysis (Chapter 1.5) is separately performed at EC level.

Since MS use different national methodologies, background activity data or emission factors in accordance with IPCC guidelines, these methodologies are reflected in the EC GHG inventory data. In general, no additional methodological information can be provided at EC level except summaries of methodologies used by MS. However, in some areas possibilities of quality improvement were defined for the estimation at MS level, and work was started in these areas including energy background data, emissions from international bunkers, emissions and removals from LUCF, and emissions from agriculture.

The EC CRF Table Summary 3 in Annex 2 provides information on methodologies and emission factors used by the Member States. These tables have been compiled on basis of the information provided by the MS in their CRF Tables Summary 3. The sector specific chapters list the methodologies and emission factors used by the Member States for each EC key source. Annex 5 includes the CRF Tables Summary 3 for those MS that submitted these tables in 2002.

1.5. Description of key source categories

A key source analysis has been carried out according to the Tier 1 method (quantitative approach) described in IPCC (2000). A key source category is defined as an emission source that has a significant influence on a country's GHG inventory in terms of the absolute level of emissions, the trend in emissions, or both. The basis of the analysis is IPCC (2000), but the source categories adopted for the analysis at EC level are more aggregated than those suggested in IPCC (2000) because of lack of data at a more disaggregated level.

In addition to the key source analysis at EC level, the MS provide a national key source analysis which can differ from the assessment at EC level. The EC key source analysis is not intended to replace key source analysis by MS. The key source analysis at EC level is carried out to identify those source categories for which overviews of MS methodologies, emission factors and quality estimates are provided.

⁴ The UNFCCC guidelines were revised in 2002 (FCCC/CP/2002/8, 28 March 2003). Parties should start using the revised guidelines for reporting the annual inventories due in the year 2004. However, the structure of the NIR as included in the revised guidelines was already used for the EC inventory report 2003, in order to make the report more transparent.

To identify key source categories of the EC, the following procedure was applied:

1. Starting point for the key source identification for this report was the CRF Table Summary 1.A. of the EC GHG inventory. All source categories where GHG emissions occur were listed, at the most disaggregated level available at EC level and split by gas. This way, a list of 68 source categories was identified.
2. For the base year only a level assessment was carried out. For all years starting from 1991 a level and a trend assessment was performed. Annex 1 shows the key sources identified in the level and trend assessments for all years from the base year to 2001.
3. This procedure resulted in the identification of 28 key source categories for the EC for 2001. The EC key sources are listed in Table 3 and ranked according to their level contribution to total EC GHG emissions in 2001. They cover 98,1 % of total EC GHG emissions in 2001.

Table 3: EC GHG source categories identified as key sources (emissions in Gg of CO₂ equivalents)

GREENHOUSE GAS SOURCE CATEGORIES	Gas	Base year	2001	Absolute change	% change	Level assessment	Cumulative total
		(Gg)					
1.A.1. Energy Industries	CO ₂	1.144.434	1.119.301	-25.133	-2%	27,2%	27,2%
1.A.3. Transport	CO ₂	695.003	833.925	138.922	20%	20,3%	47,5%
1.A.4. Other Sectors	CO ₂	635.096	655.763	20.667	3%	16,0%	63,5%
1.A.2. Manufacturing Industries and Construction	CO ₂	642.348	585.160	-57.189	-9%	14,2%	77,8%
4.D. Agricultural Soils	N ₂ O	214.489	196.818	-17.670	-8%	4,8%	82,5%
4.A. Enteric Fermentation	CH ₄	144.091	131.631	-12.460	-9%	3,2%	85,7%
2.A. Mineral Products	CO ₂	106.934	105.952	-982	-1%	2,6%	88,3%
6.A. Solid Waste Disposal on Land	CH ₄	110.982	80.295	-30.687	-28%	2,0%	90,3%
2.B. Chemical Industry	N ₂ O	106.096	49.167	-56.929	-54%	1,2%	91,5%
4.B. Manure Management	CH ₄	45.172	45.268	97	0%	1,1%	92,6%
2 F Consumption of Halocarbons and SF ₆	HFC	6.167	31.383	25.216	409%	0,8%	93,3%
1.B.2. Oil and Natural Gas	CH ₄	32.969	28.338	-4.631	-14%	0,7%	94,0%
1.A.3. Transport	N ₂ O	11.660	26.361	14.701	126%	0,6%	94,7%
2.C. Metal Production	CO ₂	25.702	23.856	-1.847	-7%	0,6%	95,3%
4.B. Manure Management	N ₂ O	23.495	21.562	-1.933	-8%	0,5%	95,8%
1.B.2. Oil and Natural Gas	CO ₂	17.247	16.377	-870	-5%	0,4%	96,2%
1.B.1. Solid Fuels	CH ₄	48.510	15.277	-33.233	-69%	0,4%	96,5%
2 E Production of Halocarbons and SF ₆	HFC	32.373	11.957	-20.416	-63%	0,3%	96,8%
2.B. Chemical Industry	CO ₂	12.884	10.769	-2.116	-16%	0,3%	97,1%
1.B.1. Solid Fuels	CO ₂	9.283	8.081	-1.202	-13%	0,2%	97,3%
1.A.4. Other Sectors	CH ₄	10.453	7.739	-2.713	-26%	0,2%	97,5%
1.A.5. Other	CO ₂	20.076	7.307	-12.770	-64%	0,2%	97,7%
2 F Consumption of Halocarbons and SF ₆	SF ₆	9.617	6.543	-3.074	-32%	0,2%	97,8%
6.B. Waste-water Handling	N ₂ O	6.492	5.579	-913	-14%	0,1%	98,0%
2 C Metal Production	PFC	5.637	3.100	-2.537	-45%	0,1%	98,0%
4.D. Agricultural Soils	CO ₂	3.208	1.946	-1.262	-39%	0,0%	98,1%
2.G. Other	CO ₂	1.111	1.295	184	17%	0,0%	98,1%
6.D. Other	CO ₂	881	420	-461	-52%	0,0%	98,1%

In the subsequent sectoral chapters (Chapters 3-9) for each key source an overview table is presented which includes the MS contributions to the EC key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates.

1.6. Information on the QA/QC plan

The EC GHG inventory is based on the annual inventories of the EC MS. Therefore, the quality of the EC inventory depends on the quality of the MS inventories, the QA/QC procedures of the MS and the quality of the compilation process of the EC inventory.

1.6.1 QA/QC of the EC Inventory

The initial checks of MS submissions are an essential component of the annual QA/QC procedure at EC level. The initial checks include two elements; checking the completeness of the MS CRF tables and checking the consistency of MS GHG data.

The checks of completeness of MS submissions are carried out by ETC-ACC by using a similar status report form as used by the UNFCCC secretariat. The completed status reports are made available to MS (through the EIONET and the circulation on 1 March); then MS can check the status reports and update information, if needed. The status reports of the MS submissions as by 4 April 2003 are included in Annex 3 of this report.

The consistency check of MS data primarily aims at the identification of main problems in time series or sub-category sums. In addition, the ETC-ACC identifies problems by comparison with the previous year's inventory submission of the MS and checks the availability of the CRF tables needed for the compilation of the EC inventory. The results of these checks are documented in the consistency and completeness report and are made available to the MS, in order to obtain, if needed, revised emission estimates or additional information before 1 April.

After the initial checks of the emission data, the ETC-ACC transfers the national data from the CRF tables into spreadsheets and into the ETC-ACC database on emissions of GHG and air pollutants. The version of the data received by ETC-ACC are numbered, in order to be traced back to their source. The ETC-ACC database is a relational database (MS ACCESS) and maintained and managed by UBA Vienna. A number of further checks are carried out during the compilation of the EC inventory and before submitting the final EC GHG inventory and inventory report.

Table 4: Quality Control activities related to the EC inventory at the UBA Vienna

Main types of checks	Check report	Checks
Initial checks of MS submissions	Status report	Complete status report form for each MS submission
	Consistency and completeness report ¹⁾	Check deviations in time series of +/-10% annually and +/-50% over the whole time period
		Check time series against previous submissions (document deviation +/-5%)
		Check sub-categories sum
		Check information availability in those CRF tables that are needed for the compilation of the EC inventory
		Check consistency between NIR and CRF
Checks during the preparation of the EC inventory	Preparation report	<p>Check that known data gaps that result in incomplete source category emission estimates are documented</p> <p>Check that MS submissions using the same input data (e.g. energy consumption, animal population data) report comparable values (i.e. analogous in magnitude) for the data (in case that these activity data are reported at EC level)</p> <p>Document any further findings and procedures applied</p> <p>Specify exact data source (e.g. are data taken from Table 1.A or Table 10)</p>
Checks before the final submission of the CRF	CRF Tables	<p>Confirm that estimates are reported for all source categories and for all years from the appropriate base year to the period of the current inventory</p> <p>Check that emissions data are correctly (1) aggregated from lower reporting levels to higher reporting levels when preparing summaries and (2) transcribed between different intermediate sheets</p> <p>Check that the number of significant digits or decimal places for common parameters, conversion factors, emission factors, or activity data are consistent across source categories; total emissions should also be reported consistently (in terms of significant digits or decimal places) across source categories</p>

	Inventory report	Check the inventory report (layout, consistency, tables and figures, references, general format)
--	------------------	--

1) The consistency and completeness reports have been sent to the MS on 1 March and are available from the EEA on request.

Sector specific checks and activities to improve the quality of the EC inventory are performed by Eurostat in the energy sector (see Chapters 3.3 and 3.6) and by JRC in the sectors agriculture and LUCF (see Chapters 6.3 and 7.2).

The circulation of the draft EC inventory and inventory report on 1 March to the EC MS for reviewing and commenting is also an element to improve the quality of the EC inventory and inventory report. The MS check their national data and information used in the EC inventory report and send updates, if necessary, and review the EC inventory report. This procedure should assure the timely submission of the EC GHG inventory and inventory report to the UNFCCC secretariat and it should guarantee that the EC submission to the UNFCCC secretariat is consistent with the MS UNFCCC submissions.

Finally, also the detailed analysis of GHG emission trends of the EC and each EC Member State after the submission of the EC inventory to the UNFCCC contributes to the improvement of the quality of the EC GHG inventory. This analysis is carried out in the annual EC GHG trend report (see EEA, 2002b); the report identifies sectoral indicators, for socio-economic driving forces of greenhouse gas emissions, by using data from Eurostat or from Member States' detailed inventories. In addition, it compares and analyses Member States' emission trends in the EC key sources and provides main explanations, either socio-economic developments or policies and measures, for these trends in some Member States.

1.6.2. Overview of QA/QC procedures in place at MS level

The following Table 5 gives an overview of QA/QC procedures in place at MS level. The information is taken from the latest available MS National Inventory Reports.

Table 5: Overview of QA/QC procedures in place at MS level as by 1 April 2003 (mainly excerpts from MS national inventory reports 2002 and 2003)

	Short description of the QA/QC procedures in place extracted from MS national inventory reports	Source
Austria	The Austrian Federal Environment Agency as the responsible body for compiling the national GHG emissions inventory is currently implementing a quality management following EN 45000, a series of European standards similar to the ISO 9000 series. The Federal Environment Agency has decided to implement a quality management system based on the European standard EN 45004, which specifies general criteria for the operation of various types of bodies performing inspections. The full implementation of the system was foreseen for June 2001, the accreditation of the Federal Environment Agency as inspection body according to EN 45004 is foreseen for 2003. The QA/QC system which is currently implemented at the Federal Environment Agency is fully compatible with the requirements of the IPCC Good Practice Guidance (IPCC, 2000).	Federal Environment Agency - Austria (2001)
Denmark	In the preparation of Denmark's annual emission inventories normal and common Quality Control procedures are performed. Work on Quality Assurance and documentation is carried out as a result of the UNFCCC's in-depth-reviews, latest resulting in the report "Report of the individual review of the greenhouse gas inventory of Denmark submitted in the year 2001". Work to improve QA/QC procedures in preparing the Danish emission inventories is included in a planned project to implement GPG and improve reporting as a consequence of Kyoto Protocol.	National Environmental Research Institute (2002)
Finland	The quality management system for the national GHG inventory is currently under development and will be implemented in the inventory of the year 2002 emissions. Statistics Finland as the National Inventory Agency will coordinate the project. The expert institutes participating in the inventory are presently building up quality systems for the inventories in their areas of expertise. The annually reported CRF tables are archived both at the Finnish Environment Institute and Statistics Finland. The method descriptions together with documents of the original data sources are archived at the Finnish Environment Institute with the exception of confidential activity data in the energy sector that are archived at Statistics Finland. The present inventory of the year 2001 emissions is not verified by a third party but in the interministrial working group.	Ministry of the Environment (2003a)
France	All actions concerning the improvement of QA/QC will be reinforced, in particular by adaptation of QA/QC instruments and procedures, extended consultation with experts in different fields, the ISO 9001 certification of the institution compiling the inventory, etc.	CITEPA (2001)
Ireland	Ireland has not yet developed formal quality assurance and quality control (QA/QC) systems on the scale recommended by the IPCC good practice guidance. The inventory preparation process employed in Ireland does incorporate a number of activities that may be regarded as fundamental elements of quality control. The emission estimates for the most important source sectors (Energy and Agriculture) are produced in three computational systems simultaneously. Firstly, simple spreadsheets are used to undertake a considerable amount of preparatory calculations and to subsequently derive the emissions estimates by combining activity data and emission factors at the most appropriate level of disaggregation. Conversion to IPCC source categories is part of this process. Secondly, the greenhouse gas emission estimates are derived by the CollectER software, as part of a much wider range of emission inventories stored in the database. Thirdly, the IPCC software is used to produce emissions in the major source categories because the results may be directly imported into the CRF file, providing a convenient starting point in the preparation of the annual CRF. This duplication provides rigorous internal checking of the calculation process and it ensures that there is consistency of application regarding units, aggregation, inputs that are common to several source categories and, in the case of Energy, the inclusion of emissions estimates supplied by contributing bodies. Simple comparison of source category totals at IPCC Level 1 or Level 2 and at the national scale provides convenient completeness checks and immediate identification of gross errors or omissions.	Environmental Protection Agency (2002)
Netherlands	In 1997, the quality assurance system ISO 9001 has been introduced to ascertain the quality of the monitoring process related to the Pollutant Emission Register (PER). All procedural activities by the Inspectorate for Environmental Protection of the Ministry of Housing, Spatial Planning and the Environment (VROM/HIMH), the Netherlands Organisation for Applied Scientific Research (TNO) and the National Institute of Public Health and Environment (RIVM) are subject to this quality control as well as the maintenance of the PER database by RIVM. However, the activities of actual data collection and emission calculations by the Task Groups are not yet part of the formal ISO quality assurance program. A number of external reviews have been conducted regarding GHG emission data in recent years, although the contents of the PER as a whole is not subjected to regular external reviews. An inventory improvement programme was started with the creation of the Working Group Emission Monitoring of GHG (WEB). In 2001, the WEB started a two-phase project, to develop a QA/QC system for the Dutch NIR/CRF process which is in line with the QA/QC guidelines from the UNFCCC and the IPCC. The first phase evaluated existing practices; the second phase is directed to develop and implement the QA/QC system itself and started in 2002.	Olivier, J.G.J, Brandes, L.J., Peters, J.A.H.W. and Coenen, P.W.H.G. (2002)

Sweden	Sweden has begun an initial quality assurance (QA), but the QA/QC plan is not fully adopted yet. Apart from the UNFCCC's In-Depth-Reviews and individual reviews on the inventories resulting in the report "Report of the individual review of the GHG inventory of Sweden submitted in the year 2001", Quality Assurance (QA) with independent review of the inventories has partly been made in 2002 and will be further developed in 2003 and 2004. The IPCC has developed guidance on good practice, which also includes good practice guidance on QA/QC. For some parts of the Swedish Emission Inventories the good practice has been implemented, except for QA. Sweden will during the next years improve its Emission Inventories and will include further elaboration of how formal QA/QC procedures could be implemented upon the full adoption of the IPCC's Good Practice Guidance.	Swedish Environmental Protection Agency (2003)
UK	The UK QA/QC system complies with the Tier 1 procedures outlined in the Good Practice Guidance (IPCC, 2000). Plans are underway to develop the system and extend the range of activities so that the system complies with Tier 2. A detailed QA/QC activities schedule until 2004 is presented including external peer reviews for key sources. The Inventory has been subject to ISO 9000 since 1994 and is liable to audit by Lloyds and the AEAT internal QA auditors. The National Atmospheric Emissions Inventory has been audited favourably by Lloyds on two occasions in the last four years. The emphasis of these audits was on authorisation of personnel to work on inventories, document control, data tracking and spreadsheet checking. As part of the Inventory management structure there is a nominated officer responsible for the QA/QC system –the QA/QC Co-ordinator. Special QA/QC activities undertaken in 2000-2002 included verification of the inventory, revision of halocarbon estimates, expert peer review of fuel combustion sources of carbon dioxide, revision of estimates of methane emissions from landfill, in depth review of the UK National Inventory by the UNFCCC, September 2002, review of the estimation of emissions from aviation in the UK greenhouse gas inventory and compliance check of the current UK National Inventory Report structure to the proposed requirements of the UNFCCC.	National Environmental Technology Centre (2002, 2003)

1.7. General uncertainty evaluation

The CRF Table 7 in Annex 2 shows information on completeness and quality of GHG emissions for the EC key sources. These estimates are based on the information provided by the MS in their CRF Tables 7. The overview tables in Chapters 3-9 provide this information for each EC key source.

Table 6 gives an overview of information provided by MS on uncertainty estimates in their latest available National Inventory Reports and presents summarised results of these estimates. The overview table provides general information on uncertainty estimates of the MS and quantified uncertainty estimates at total gas level, if available.

Table 6: Overview of uncertainty estimates available from MS (mainly excerpts from MS national inventory reports)

	Uncertainty estimates extracted from MS national inventory reports	Source															
Austria	<p>Uncertainty analysis including systematic and random uncertainty was carried out for CO₂, CH₄ and N₂O for 1990 and 1997. The results of the calculations are as follows:</p> <table> <thead> <tr> <th>Total uncertainty</th> <th>CO₂</th> <th>CH₄</th> <th>N₂O</th> <th>Total GHG emissions (excluding fluorinated gases)</th> </tr> </thead> <tbody> <tr> <td>1990</td> <td>2,3 %</td> <td>48,3 %</td> <td>89,6 %</td> <td>9,8 %</td> </tr> <tr> <td>1997</td> <td>2,1 %</td> <td>47,4 %</td> <td>85,9 %</td> <td>8,9 %</td> </tr> </tbody> </table>	Total uncertainty	CO ₂	CH ₄	N ₂ O	Total GHG emissions (excluding fluorinated gases)	1990	2,3 %	48,3 %	89,6 %	9,8 %	1997	2,1 %	47,4 %	85,9 %	8,9 %	Federal Environment Agency - Austria (2001)
Total uncertainty	CO ₂	CH ₄	N ₂ O	Total GHG emissions (excluding fluorinated gases)													
1990	2,3 %	48,3 %	89,6 %	9,8 %													
1997	2,1 %	47,4 %	85,9 %	8,9 %													
Denmark	<p>The National Inventory Report refers to Denmark's 2nd National Communication where the uncertainty of NMVOC, CH₄ and N₂O is assumed to be the highest (perhaps with an uncertainty factor 2). The uncertainty of CO and NO_x inventories is assumed to be less than 30-40 % and the uncertainty of CO₂ may be as low as 1-2 %. Applying the methodology mentioned in Annex 1 of the Reporting Instructions of the Revised 1996 IPCC Guidelines for National GHG Inventories these estimates lead to an overall uncertainty of the GHG emissions in CO₂ equivalents of +/- 23 %. This estimate does not take into account the 35 % uncertainty of the GWP-factors. Sensitivity analysis shows that it is the huge uncertainty of N₂O emissions from agricultural soils, which are the key factor for overall uncertainty of the Danish GHG inventory. Work is underway to implement uncertainty according to GPG. The results of this work are expected to be included in the Danish NIR 2004.</p>	National Environmental Research Institute (2002)															
Finland	<p>In the year 2001 inventory, the uncertainty assessment was performed for the first time using the Monte Carlo simulation (Tier 2 method). The uncertainties in the input parameters were estimated using the IPCC default uncertainties, expert elicitation, domestic and international literature and available measurement data. A separate report on the uncertainty estimates (Monni and Syri 2003) will be published in 2003. According to the calculations, the uncertainty estimates for 2001 were as follows:</p> <table> <thead> <tr> <th>Total GHGs</th> <th>CO₂</th> <th>CH₄</th> <th>N₂O</th> <th>Fluorinated gases</th> </tr> </thead> <tbody> <tr> <td>-5/+6%</td> <td>-4/+6%</td> <td>-19/+20%</td> <td>-33/+40%</td> <td>-53/+32%</td> </tr> </tbody> </table> <p>The share of CO₂ emissions from fuel combustion, which has low uncertainties, is large in Finland, thus resulting in a rather low total inventory uncertainty, though some input parameters in other emission categories have very large uncertainties.</p>	Total GHGs	CO ₂	CH ₄	N ₂ O	Fluorinated gases	-5/+6%	-4/+6%	-19/+20%	-33/+40%	-53/+32%	Ministry of the Environment (2003a)					
Total GHGs	CO ₂	CH ₄	N ₂ O	Fluorinated gases													
-5/+6%	-4/+6%	-19/+20%	-33/+40%	-53/+32%													
France	<p>Work is underway for estimating uncertainties of GHG emissions according to the Good Practice Guidance (IPCC, 2000). The uncertainties of CO₂ and SO₂ from energy use are assumed to be less than 5 %.</p>	CITEPA (2001)															
Germany	<p>The report states that partly emission uncertainties are considerable. This is due to uncertainties of activity data and emission factors and - to a much lesser extent - to a lack of information on emission causing activities. In general, the uncertainty of combustion-related emissions is considerably lower than uncertainty of non-combustion related emissions. The uncertainties are estimated to be higher for emissions after 1999 because they have to be considered as preliminary estimates. For qualitative estimates of emission uncertainties the report refers to the relevant CRF Tables.</p>	Bericht 2002 der Bundesrepublik Deutschland (2002)															
Ireland	<p>The Tier 1 method provided by IPCC (2000) has been used to make an uncertainty estimate of the Irish inventory time series for the years 1990-2000. This analysis results in an overall uncertainty of approximately 11 percent in the 2000 inventory of greenhouse gases and a trend uncertainty of 5 percent for the period 1990 to 2000. This outcome is determined largely by the uncertainty in the estimate of N₂O emissions from agricultural soils, where an emission factor uncertainty of 100 percent is assumed in order to complete the analysis. This highlights the need for more reliable data on this particular emission source in Ireland. Two-thirds of total Irish emissions, i.e. the proportion contributed by CO₂, are estimated to have an uncertainty of less than 2 percent. When CH₄ is included, bringing the proportion up to 85 percent, the total uncertainty remains less than 4 percent, even though there are large uncertainties assigned to the CH₄ emission factors in most source categories. However, it is the influence of N₂O that leads to a substantial uncertainty in total emissions. This influence is not as large in the case of the trend, due to the modest change in emissions of N₂O from 1990 to 2000 and the relatively small share of this gas in total emissions. The impact of HFC, PFC and SF₆ on inventory uncertainty in the year 2000 is negligible because these gases account for less than 1 percent of total emissions.</p>	Environmental Protection Agency (2002)															

	Uncertainty estimates extracted from MS national inventory reports	Source																								
Netherlands	<p>The Netherlands estimated uncertainty in annual emissions and in emission trends by applying the IPCC Tier 1 uncertainty approach at the level of the IPCC list of possible key sources. The results of the uncertainty estimates for 2000 CO₂ equivalent emissions is as follows:</p> <table> <tr> <td>Total GHG</td> <td>CO₂</td> <td>CH₄</td> <td>N₂O</td> <td>HFCs</td> <td>PFCs</td> <td>SF₆</td> </tr> <tr> <td>±4 %</td> <td>±3 %</td> <td>±25 %</td> <td>±50 %</td> <td>±50 %</td> <td>±50 %</td> <td>±50 %</td> </tr> </table> <p>The results of the uncertainty estimates for the trend 1990-2000 CO₂ equivalent emissions is as follows:</p> <table> <tr> <td>Total GHG</td> <td>CO₂</td> <td>CH₄</td> <td>N₂O</td> <td>Fluorinated gases</td> </tr> <tr> <td>±3 %</td> <td>±3 %</td> <td>±7 %</td> <td>±12 %</td> <td>±11 %</td> </tr> </table>	Total GHG	CO ₂	CH ₄	N ₂ O	HFCs	PFCs	SF ₆	±4 %	±3 %	±25 %	±50 %	±50 %	±50 %	±50 %	Total GHG	CO ₂	CH ₄	N ₂ O	Fluorinated gases	±3 %	±3 %	±7 %	±12 %	±11 %	Olivier, J.G.J., Brandes, L.J., Peters, J.A.H.W. and Coenen, P.W.H.G. (2002)

±4 %	±3 %	±25 %	±50 %	±50 %	±50 %	±50 %																				
Total GHG	CO ₂	CH ₄	N ₂ O	Fluorinated gases																						
±3 %	±3 %	±7 %	±12 %	±11 %																						
Spain	The Spanish report mentions that the assessment of uncertainty (estimation of emission quality) is shown in Table 7 of the CRF using the quality codes H (high), M (medium), and L (low). This ordinal classification of quality is only a first stage in the analysis of the uncertainty associated with the inventory estimations. Work is now in progress for the implementation of a quantitative estimation of uncertainty in accordance with the approach recommended in IPCC (2000).	Ministry of the Environment (2003b)																								
Sweden	The uncertainty in reported emissions arises from the uncertainty in the activity data, uncertainty in emission factors and uncertainty arising from whether all (major) sources of emissions are included in the inventory. For most sectors Swedish official statistics are used as activity data, except for industrial processes, emissions from F-gases and for solvent use where information comes from the industries annual Environmental Reports. Used emission factors originate either from measurements from existing Swedish plants or from comparable European installations, where IPCC default emission factors are not used. In 2003 validation of uncertainties for the emission estimates will be started. It is assumed that the uncertainty is largest for the inventories of CH ₄ and N ₂ O, perhaps with an uncertainty factor of 2, for NMVOC, which have been recalculated possibly in the order of 50%, while the uncertainty on the CO, SO ₂ and NO _x inventories is assumed to be less than 30 - 40% and the uncertainty with the CO ₂ may be as low as 1 - 2%.	Swedish Environmental Protection Agency (2003)																								
UK	<p>Quantitative estimates of the uncertainties in the emissions were calculated by using Monte Carlo simulation. This corresponds to the IPCC Tier 2 approach discussed in the Good Practice Guidance (IPCC, 2000). The results for the UK are as follows (calculated as 2s/E where s is the standard deviation and E is the mean, calculated in the simulation):</p> <table> <tr> <td></td> <td>Total GHG</td> <td>CO₂</td> <td>CH₄</td> <td>N₂O</td> <td>HFCs</td> <td>PFCs</td> <td>SF₆</td> </tr> <tr> <td>Emissions 2001</td> <td>13%</td> <td>2,2%</td> <td>14%</td> <td>204%</td> <td>25%</td> <td>19%</td> <td>13%</td> </tr> <tr> <td>Range of likely % change 2001 and 1990</td> <td>-15% / -10%</td> <td>-6,9% / -4,2%</td> <td>-49% / -31%</td> <td>-73% / -17%</td> <td>-47% / 9%</td> <td>-76% / -59%</td> <td>103% / 192%</td> </tr> </table> <p>The Tier 1 approach based on the error propagation equations suggests an uncertainty of 17 % in the combined GWP total emissions in 2001. The analysis also estimates an uncertainty of 2 % in the trend between 1990 and 2000.</p>		Total GHG	CO ₂	CH ₄	N ₂ O	HFCs	PFCs	SF ₆	Emissions 2001	13%	2,2%	14%	204%	25%	19%	13%	Range of likely % change 2001 and 1990	-15% / -10%	-6,9% / -4,2%	-49% / -31%	-73% / -17%	-47% / 9%	-76% / -59%	103% / 192%	National Environmental Technology Centre (2003)

1.8. General assessment of the completeness

1.8.1. Completeness of MS submissions

The EC GHG inventory is compiled on basis of the inventories of the 15 EC MS. Therefore, the completeness of the EC inventory depends on the completeness of the Member States submissions.

Table 7 summarises timeliness and completeness of the MS submissions as by 4 April 2003. It shows that nine MS submitted their GHG inventories in time to the European Commission, i.e. by 31 December 2002. Eleven MS submitted all or almost all tables (i.e. more than 90 %) of the CRF tables for 1990-2001. All MS provided information on fluorinated gases, but there are still some data gaps in the time series 1990-2001. The completeness of national submissions with regard to individual CRF tables in the 2003 submission can be found in the status reports in Annex 3. In addition, MS information on the completeness of their emission estimates at source level can be seen from the overview tables in Chapters 3-8 and in the CRF Tables 7 of the MS in Annex 5.

Table 7: Date of submissions (updates submitted), years covered and CRF Tables available from MS by 4 April 2003

MS	Submission dates	Latest data available	Years covered	CRF Tables¹⁾

1.8.2. Data gaps and gap filling

The EC GHG inventory is compiled by using the inventory submissions of the 15 EC MS. For data gaps in MS inventory submissions, the following procedure is applied by EEA/ETC-ACC:

1. If emission data are available for previous years:

- For CH₄, N₂O, HFCs, PFCs and SF₆, emissions reported for the most recent previous year are taken as an approximated estimate for the missing year.
- For CO₂ emissions of all CRF categories except sector 1 ‘Energy’ also the emissions reported for the most recent previous year are taken as an approximated estimate for the missing year.
- For CO₂ emissions of CRF sector 1 ‘Energy’ the latest data reported by the MS is used and extrapolated on the basis of percentage changes of CO₂ emissions from fossil fuel combustion as estimated for more recent years by Eurostat for this MS. The Eurostat estimates are compiled using the IPCC reference approach and energy balance data provided annually by MS.

2. If emission data are not available for any year between 1990 and 2001, data gaps are not filled.

The following data gaps existed by 4 April 2003:

Table 9: Overview of data gaps by 4 April 2003

Member State	CO ₂	CH ₄	N ₂ O	HFCs	PFCs	SF ₆
Belgium				1990-1994	1990-1994	1990-1994
Greece						1990-2001
Ireland				1990-1994	1990-1994	1990-1994
Luxembourg	1991-1993 ¹⁾	1991-1993	1991-1993	1990-2000	1990-2000	1990-2000

1) Luxembourg provided total CO₂ emissions for 1991-1993 but without sector and category split

For the EC inventory 2003, the data gap procedure has been applied for the following MS, years and gases (Table 10):

- For Belgium and Ireland, fluorinated gas emissions were estimated for 1990-1994 on basis of 1995 data.
- For Luxembourg, fluorinated gas emissions were estimated for 1990-2000 on basis of 2001 data. Emissions of CO₂, CH₄ and N₂O were estimated for 1991-1993 on basis of 1990 data. For the sector split of CO₂ emissions 1991-1993, which was not provided by Luxembourg, the split of 1990 was extrapolated by the percentage change of total CO₂ emissions for these years (which is available from Luxembourg).

No gaps were filled for Greece for SF₆.

Table 10: Data gap filling for Belgium, Ireland and Luxembourg (Gg of CO₂ equivalents)

Belgium	1990	1991	1992	1993	1994	1995
HFC	339	339	339	339	339	339
PFC	0	0	0	0	0	0
SF ₆	96	96	96	96	96	96

Ireland	1990	1991	1992	1993	1994	1995
HFC	21	21	21	21	21	21
PFC	75	75	75	75	75	75
SF ₆	83	83	83	83	83	83

Luxembourg	1990	1991	1992	1993	1994	1995
HFC	43	43	43	43	43	43
PFC	0	0	0	0	0	0
SF ₆	4	4	4	4	4	4
Luxembourg	1996	1997	1998	1999	2000	2001
HFC	43	43	43	43	43	43
PFC	0	0	0	0	0	0
SF ₆	4	4	4	4	4	4

Luxembourg	Most recent previous year reported:	Data gap filling for years:			
		1990	1991	1992	1993
CH ₄	498	498	498	498	498
N ₂ O	208	208	208	208	208
Total CO ₂ emissions without LUCF as reported by Luxembourg	10.152	9.724	9.572	9.864	
Percentage change applied to CO ₂ emissions at sectoral and source category level		-4,2%	-5,7%	-2,8%	

Note: Values are shaded for estimates derived by gap filling.

1.8.3. Data basis of the EC GHG inventory

The EC GHG inventory 2003 data consist of:

- the GHG submissions of the MS to the Commission in 2003 (if available, data were taken from CRF Tables Summary 1.A; in a few cases also data from CRF Tables 10 was used),
- previous GHG submissions, in cases where MS did not provide the complete time series for each gas in 2003, and
- emission estimates derived from data gap filling in cases where no data was available for a specific gas and year (used only in few cases).

Tables 11-14 show the data basis of the EC GHG inventory 2003. Values in white cells without a frame are data provided by MS in 2003 in the CRF Tables Summary 1.A. Light shaded values are taken from MS 2003 CRF Tables 10. Framed cells indicate that the emission data has been taken from MS submissions in previous years. Dark shaded values derive from gap filling. ‘NE’ (‘not estimated’) indicates that data are not available and that no gap filling has been made.

Table 11: Data basis of CO₂ emissions excluding LUCF in Gg

Note: Values in white cells without a frame are data provided by MS in 2003 in the CRF Tables Summary 1.A. Light shaded values are taken from MS 2003 CRF Tables 10. Framed cells indicate that the emission data have been taken from MS submissions in previous years. Dark shaded values derive from gap filling. ‘NE’ (‘not estimated’) indicates that data are not available and that no gap filling has been made.

1.8.4. Geographical coverage of the EC inventory

Table 15 shows the geographical coverage of the MS national GHG inventories as submitted under the Monitoring Mechanism. As the MS national GHG inventories are used for the compilation of EC GHG inventory, the table also shows the geographical coverage of the EC inventory.

Table 15: Geographical coverage of the EC inventory

MS	Geographical coverage
Austria	Austria
Belgium	Belgium
Denmark	Denmark (excluding Greenland and the Faroe Islands)
Finland	Finland and Ahvenanmaa (Aaland)
France	France, the Overseas Departments (Guadeloupe, Martinique, Guyana and Reunion) and the Overseas Territories (New Caledonia, Wallis et Futuna, French Polynesia, Mayotte, Saint-Pierre et Miquelon)
Germany	Germany
Greece	Greece
Ireland	Ireland
Italy	Italy

Luxembourg	Luxembourg
Netherlands	Netherlands including a twelve miles zone from the coastline and inland water bodies, emissions from offshore oil and gas production at the Netherland's part of the continental shelf, excluded are Aruba and the Netherlands Antilles
Portugal	Portugal, Madeira, Azores
Spain	Spanish part of Iberian Mainland, Canary Islands, Balearic Islands, Ceuta and Melilla
Sweden	Sweden
United Kingdom	England, Scotland, Wales, Northern Ireland

1.9. Differences between EC submission and MS submissions in 2002

In the UNFCCC draft synthesis and assessment report of the EC GHG inventory 2002, inconsistencies between the EC submission 2002 (for the inventory 2000) and the sum of the EC MS submissions 2002 to the UNFCCC secretariat were identified.

Table 16: Inconsistencies between the EC submission 2002 and the sum of the EC MS submissions 2002 (Gg for 2000)

	Sum of MS submissions 2002	EC submission 2002	Difference
CO ₂	3.324.800	3.333.697	8.897
CO ₂ removals	-180.681	-181.437	756
CH ₄	16.275	16.282	7
N ₂ O	1.091	1.096	5

Source: UNFCCC draft synthesis and assessment report 2002

The most important reason for these inconsistencies between the EC CRF submission and the sum of the EC MS submissions in 2002 is the reporting in category 5 of CRF Table Summary 1.A. Footnote five requires Parties to report net emissions (emissions - removals) from LUCF in each sub-category 5 and in the total sum of category 5. Only a single number should be placed in either the CO₂ emissions or CO₂ removals column, as appropriate. 13 Member States reported net removals from LUCF for 2000, two Member States (Greece and the United Kingdom) reported net CO₂ emissions. At EC level, CO₂ removals were larger than CO₂ emissions. Therefore, net removals were reported that resulted from adding the net removals of the 13 MS and deducting the net emissions of Greece and the UK. This means that total CO₂ emissions at EC level do not include net emissions from LUCF of Greece and the UK. (These net emissions from LUCF of Greece and the UK reduce net removals of the EC.) The sum of CO₂ emissions of the national submissions to the UNFCCC secretariat includes net emissions of Greece and the UK and therefore is higher (see Table 17). Therefore, also the sum of CO₂ removals in the national submissions to the UNFCCC is higher.

A second reason for inconsistencies are data updates of Greece, Ireland and Italy provided to the UNFCCC after 15 April 2002, which could therefore not be included in the EC inventory (which was submitted to the UNFCCC on 15 April 2002).

Table 17 shows the differences in the submissions between the EC submission 2002 and the sum of the EC MS submissions 2002.

Table 17: Breakdown of the inconsistencies between the EC submission 2002 and the sum of the EC MS submissions 2002 (Gg for 2000)

	Total CO ₂ emissions			Net CO ₂ emissions/removals from LUCF		
	EC submission 2002	MS submission 2002	Differential	EC submission 2002	MS submission 2002	Differential
Austria	66.102	66.102	0	-7.633	-7.633	0
Belgium	127.040	127.040	0	-1.823	-1.823	0

Chapter 2: EC GHG emission trends

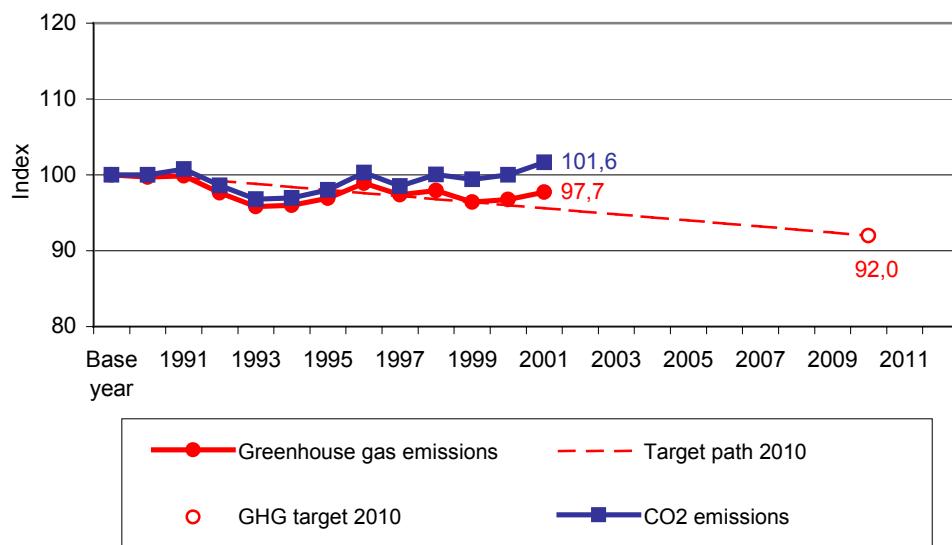

This chapter presents the main GHG emission trends in the EC. First, aggregate results are described as regards total GHG emissions and progress towards fulfilling the EC Kyoto target. Then, emission trends are briefly analysed at gas and source level and a short overview of MS contribution to EC GHG trends is given. The EEA will provide a more detailed analysis on the EC GHG emission trends in its report *Greenhouse gas emission trends in Europe, 1990-2001*. Finally, also the trends of indirect GHG and SO₂ emissions are presented.

2.1. Aggregated GHG emission trends

Total GHG emissions without land-use change and forestry (LUCF) in the EC decreased between the base year and 2001 by 95.735 Gg (-2,3 %). In the Kyoto Protocol, the EC agreed to reduce its GHG emissions by 8 % by 2008-2012, from 1990 levels. Assuming a linear target path from 1990 to 2010, total EC GHG emissions were 2,1 index points above this target path in 2001 (Figure 1).

CO₂ is by far the most important GHG, accounting for 82 % of total EC emissions in 2001. In 2001, EC CO₂ emissions without LUCF were 1,6 % above 1990 levels.

Figure 2: EC GHG emissions 1990-2001 compared with target 2008-2012 (excl LUCF)

Note (1): The linear target path is not intended as an approximation of past and future emission trends. It provides a measure of how close the EC emissions in 2001 are to a linear path of emissions reductions from 1990 to the Kyoto target for 2008-2012, assuming that only domestic measures will be used. Therefore, it does not deliver a measure of (possible) compliance of the EC with its GHG targets in 2008-2012, but aims at evaluating overall EC GHG emissions in 2001. The unit is index points with 1990 emissions being 100.

Note (2): GHG emission data for the EC as a whole do not include emissions and removals from LUCF. In addition, no adjustments for temperature variations or electricity trade are considered.

Note (3): For fluorinated gases the base year 1995 was used for all Member States, which is in line with the base year indicated so far by most MS individually.

2.2. GHG emission trends by gas

Table 18 gives an overview of the main trends in EC GHG emissions and removals for 1990-2001. In 2001 CO₂ emissions made up 82 % of the total GHG emissions in the EC. This was an increase of 54.417 Gg (1,6 %) compared to 1990. This increase was compensated by decreases in CH₄ and N₂O emissions in the same period: CH₄ decreased by 84.557 Gg (-20,4 %) and N₂O decreased by 64.452 Gg (-15,8 %). Fluorinated gases showed opposing trends. While HFC and SF₆ emissions increased by 17.715 Gg (69,0 %) and 1.226 Gg (14,7 %), PFC emissions decreased by 7.875 Gg (-58,8 %).

2.3. GHG emission trends by source

Table 19 gives an overview of EC GHG emissions in the main source categories for 1990-2001. The emissions from the largest source category ‘Energy’ with an 81 % share of the total emissions, increased by 34.170 (1,0 %). This increase was offset by decreases in the second-, third- and fourth-largest categories: emissions from ‘Agriculture’ decreased by 33.543 Gg (-7,7 %), emissions from ‘Industrial Processes’ by 50.861 Gg (-16,8 %), and emissions from ‘Waste’ by 32.498 Gg (-24,1 %).

Table 19: Overview of EC GHG emissions in the main source categories 1990 to 2001 in CO₂ equivalents (Gg)

GREENHOUSE GAS SOURCE AND SINK CATEGORIES	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001

2.4. GHG emission trends by MS

Table 20 gives an overview of MS contribution to the EC GHG emissions for 1990-2001. The largest emitter with a 24,2 % share of the total EC emissions in the year 2001 was Germany with 993.505 Gg and the smallest with a 0,15 % share was Luxembourg with 6.077 Gg.

Germany reduced its emissions significantly (-18 %) between 1990 and 2001, although the emissions increased again between 2000 and 2001 (1,2 %). Similarly, the second-largest emitter, the United Kingdom reduced its emissions by 12 % between 1990 and 2001, though they increased between 2000 and 2001 by 1,3 %. The third-largest emitter, France, stabilised its 2001 emissions at the level of 1990, despite a 0,5 % increase compared to 2000. The smallest emitter Luxembourg decreased its emissions continuously from 1990 to 2001; the overall reduction from the 1990 level was 44 %.

Table 20: Overview of MS contribution to EC GHG emissions excluding LUCF from 1990 to 2001 in CO₂ equivalents (Gg)

2.5. Emission trends for indirect GHG and SO₂

CO, NO_x, NMVOC and SO₂ emissions have to be reported to the UNFCCC secretariat because they influence climate change indirectly: CO, NO_x and NMVOC are precursor substances for ozone which itself is a greenhouse gas. Sulphur emissions produce microscopic particles (aerosols) that can reflect sunlight back out into space and also affect cloud formation. Table 21 shows the total indirect GHG and SO₂ emissions in the EC between 1990-2001. All emissions were reduced significantly from the 1990 levels: the largest reduction was achieved in SO₂ (-63,6 %) followed by CO (-40,2 %), NMVOC (-29,4 %) and NO_x (-25,8 %).

Table 21: Overview of EC indirect GHG emissions 1990 to 2001 in Gg

GREENHOUSE GAS EMISSIONS	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001
	Gg

Table 22 shows the NO_x emissions of the EC MS between 1990-2001. The largest emitters, the United Kingdom, Germany and France, that made up 47,9 % of the total NO_x emissions in 2001, reduced their emissions from the 1990 levels. This was counterbalanced by increases from Greece, Ireland, Spain and Portugal. All other EC MS reduced their emissions.

Table 24 shows the NMVOC emissions of the EC MS between 1990-2001. The largest emitters France, Spain and Germany that made up 58,5 % of the total NMVOC emissions in 2001, reduced their emissions from the 1990 levels. This was counterbalanced by the increases from Greece and Portugal. All other EC MS reduced their emissions.

Chapter 3: Energy (CRF sector 1)

This chapter starts with an overview on emission trends in CRF sector 1 ‘Energy’. Then a section on methodological issues and uncertainty presents for each EC key source an overview table which includes the MS contributions to the key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates. In addition, the chapter includes sections on sector specific QA/QC, recalculations, the reference approach and international bunkers.

3.1. Overview of sector

CRF sector 1 ‘Energy’ contributes 81 % of the total GHG emissions and is thereby the largest emitting sector in the EC. The most important energy-related gas is CO₂ that makes up 79 % of the total GHG emissions. Total GHG emissions from this sector increased by 1 % from 3.310 Tg in 1990 to 3.344 Tg in 2001 (Figure 3). In 2001, emissions increased by 1,7 % compared to 2000.

Figure 3: EC GHG emissions 1990-2001 from CRF sector 1 ‘Energy’ in Tg

3.2. Methodological issues and uncertainties

Tables 26-36 present for each EC key source in CRF sector 1 an overview on MS contributions to the key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates. Therefore, the overview tables also aim at making transparent the compilation of CRF Summary Table 3 and CRF Table 7 of the EC submission.

3.3. Sector-specific QA/QC

The main sector specific QA/QC activity is the project lead by Eurostat on the harmonisation of the energy data used for energy balances and CO₂ inventories. The work programme for this project foresees that Member States perform the following tasks:

- examine the energy data used by the two submissions (CRF to UNFCCC and the European Commission, DG Environment, and joint questionnaires to Eurostat and IEA) for 1990, 1995 and 2000 and identify and explain the differences;
- establish a procedure at national level that will eliminate discrepancies in the two reporting mechanisms in future; this procedure will be agreed with Eurostat;
- provide the updated energy data in the form of annual questionnaires for the period 1990-2000 ensuring comparable data under the two reporting mechanisms.

At the end of year 2000 the first countries co-financed to carry out this work were Denmark, Sweden, the Netherlands and Norway. In 2001 Eurostat continued this project with the provision of grants to Austria, Germany, France and the United Kingdom. In 2002 grants were issued for Ireland, Italy and Portugal. In 2003 a call for proposals for grants will be launched to the remaining EC countries not yet participating to this project. Denmark, Sweden, Austria, the Netherlands, and the United Kingdom have already submitted the final report to Eurostat.

Following the submission of each Member State's final report, Eurostat will update information in its database and will be in the position to produce CO₂ emission figures based on the energy balances, with minimum deviation from those reported by the Member States and a full understanding of any discrepancies. This will help to improve the quality of the EC GHG inventory for sector 1 ‘Energy’.

3.4. Sector-specific recalculations

Table 37 shows that in the energy sector the largest recalculations in absolute terms were made for CO₂. However, in relative terms the recalculations of CO₂ emissions in the energy sector were below 0,5 %.

Table 37: Recalculations of total greenhouse gas emissions and recalculations of greenhouse gas emissions in CRF sector 1 ‘Energy’ for the years 1990 and 2000 by gas in Gg and percent

1990	CO ₂		CH ₄		N ₂ O		HFCs		PFCs		SF ₆

Energy	9.928	0,31%	-1.332	-2,15%	3.184	5,79%	NO	NO	NO	NO	NO	NO

3.5. Comparison sectoral approach/reference approach

The IPCC reference approach for CO₂ from fossil fuels for the EC is based on Eurostat energy data (New Cronos database, version October 2002). Energy statistics are submitted to Eurostat by MS on an annual basis with the five joint Eurostat/IEA/UNECE questionnaires on Solid Fuels, Oil, Natural Gas, Electricity & Heat, and Renewables & Wastes. On the basis of this information Eurostat compiles the annual energy balances which are used for the estimation of CO₂ emissions from fossil fuels by MS and for the EC as a whole.

The Eurostat data for the EC IPCC reference approach includes activity data, net calorific values and carbon emission factors. In the CRF Tables 1.A(b) some fuel categories are grouped and average net calorific values are used: ‘Orimulsion’ is included in ‘Residual Fuel Oil’. ‘Natural Gas Liquids’ is included in ‘Crude oil’. ‘Other Kerosene’ is included in ‘Total Kerosene’. ‘Anthracite’, ‘Coking Coal’ and ‘Other Bituminous Coal’ are referred to in the Eurostat New Cronos database as ‘Hard coal’ and are included in CRF Tables 1.A(b) under ‘Other Bituminous Coal’. ‘Sub-bitumenous Coal’ and ‘Peat’ are included in ‘Lignite’. ‘Solid Biomass’, ‘Liquid Biomass’ and ‘Gas Biomass’ is included in ‘Total Biomass’. For international bunkers, only fuel consumption for international navigation is available separately; data on international aviation are not estimated separately. Therefore, total CO₂ emissions as estimated with the IPCC reference approach on basis of Eurostat data include CO₂ emissions from international aviation. For the calculation of CO₂ emissions, the IPCC default carbon emission factors adjusted for the fraction non-oxidised are used in the Eurostat New Cronos database.

The IPCC reference approach method at EC level is a three-step process:

Step 1: For each MS, annual data on energy production, imports, exports, international bunkers (except international aviation) and stock changes are available in the Eurostat database in fuel specific units (i.e. kt (=1000 tons) for solid fuels and petroleum products, TJ for natural gas). The apparent consumption in TJ is calculated for each MS by using country-specific average net calorific values. These net calorific values are updated annually for solid fuels together with the energy data in the New Cronos database; for petroleum products the

net calorific values are kept constant. For groups of fuels average weighted net calorific values are used, which is the case for ‘Other Bituminous Coal’ and ‘Lignite’.

Step 2: The EC CRF Tables 1.A(b) are calculated by adding the relevant MS activity and emission data, as calculated under step 1. The net calorific values provided for the EC in CRF Tables 1.A(b) are calculated from dividing apparent consumption in TJ by apparent consumption in fuel specific units for each fuel. Therefore, these net calorific values are ‘implied calorific values’; there are no fuel specific net calorific values at EC level.

Step 3: For the calculations of carbon stored in Tables 1.A(d), Eurostat data on non-energy use of fuels are used, as reported by MS in the joint questionnaire. For the fraction of carbon stored and carbon emission factors IPCC default values are taken (IPCC, 1997).

Table 38 shows the apparent energy consumption and CO₂ emissions from fossil fuel combustion from 1990-2000 as provided in Tables 1.A(b) in the annex. Total fossil fuel energy consumption increased by 6,7 % between 1990 and 2000, whereas CO₂ emissions from fossil fuel combustion increased by 0,6 %.

Table 38: Apparent EC energy consumption (in TJ) and EC CO₂ emissions from fossil fuel combustion (in Gg)

	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000
Liquid fuels	22.761.496	23.482.133	23.817.546	23.543.083	23.722.534	24.016.584	24.503.293	24.496.382	25.054.141	24.886.527	24.470.374
Solid fuels	12.561.949	11.859.600	11.056.226	10.283.864	10.133.182	9.901.371	9.783.665	9.305.916	9.295.693	8.626.103	8.945.734
Gaseous fuels	9.298.421	10.036.650	9.929.083	10.562.050	10.621.111	11.446.721	12.778.070	12.669.683	13.211.329	13.799.696	14.179.877
Total energy consumption	44.621.865	45.378.382	44.802.854	44.388.997	44.476.826	45.364.676	47.065.027	46.471.982	47.561.162	47.312.327	47.595.985
CO ₂ emissions	3.200.404	3.213.914	3.148.460	3.100.972	3.092.535	3.131.112	3.235.276	3.169.289	3.239.958	3.197.927	3.219.475

Table 39 summarises the percentage deviation of CO₂ emissions from the IPCC reference approach applied to the EC based on Eurostat data and the sectoral approach available from MS. The main reason for this difference is that Eurostat energy data do not separate fuel combustion from international aviation. If fuel combustion from international aviation is added to the sectoral approach (from MS), the percentage differences are much smaller.

Table 39: Differences between EC CO₂ emissions from fuel combustion (CRF 1A) using the IPCC reference approach (Eurostat data) and sectoral approach (MS data)

	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000
Percentage difference between reference approach (Eurostat data) and sectoral approach (MS data)	2,02%	1,29%	1,37%	1,63%	1,42%	1,57%	2,27%	2,23%	2,84%	2,25%	2,34%
Percentage difference between reference approach (Eurostat) and sectoral approach (MS) including emissions from international aviation	0,23%	-0,45%	-0,55%	-0,50%	-0,79%	-0,71%	-0,10%	-0,34%	0,09%	-0,67%	-0,73%

Differences are also observed when comparing the estimates for CO₂ emissions from fossil fuels from the IPCC reference approach of the EC MS with the estimates from the reference approach calculated using Eurostat energy balance data. Table 40 provides an overview by MS on differences between the Eurostat and national reference approach for the years 1990 and 2000, as far as available. The differences can occur due to differences in the basic energy data or due to differences when calculating CO₂ emissions from the basic energy data.

Main reasons for diverging energy data:

- A main reason for differences in the basic energy data is the exclusion of fuels from international aviation in the national reference approach (in Eurostat data this exclusion is not possible).
- A second reason for differences is the use of different calorific values (CV) mainly for oil products, BKB (lignite briquettes) and patent fuels. For BKB and patent fuels, Eurostat is using the same CV for all countries which differs from the calorific values used by the MS.
- A third reason for diverging MS and Eurostat estimates are small differences in the basic energy balance data reported by MS to Eurostat (in the joint questionnaires) and to the Commission and the UNFCCC (in the CRF tables).

To resolve these differences Eurostat launched a project for harmonisation of the two (joint questionnaires and CRF) reporting systems of energy data and for revision of reported energy data back to 1990 (see Chapter 3.3).

Main reasons for diverging CO₂ emissions:

- A main reason for diverging CO₂ emissions are differences in the treatment of non-energy use of fossil fuels and carbon stored.
- A second reason is the use of country specific emission factors. The Eurostat reference approach uses the IPCC default emission factors.

Table 40: Comparison between Eurostat and national Reference Approach for CO₂ from fuel combustion (CRF 1A)⁶

Austria

1990	Eurostat reference approach		National reference approach		Percentage difference	
	Apparent consumption (TJ)	CO ₂ emissions (Gg)	Apparent consumption (TJ)	CO ₂ emissions (Gg)	Apparent consumption (TJ)	CO ₂ emissions (Gg)
Liquid fossil fuels	442.065	29.594	434.126	27.381	-1,8%	-7,5%
Solid fossil fuels	169.442	16.283	168.733	13.503	-0,4%	-17,1%
Gaseous fossil fuels	219.239	11.898	219.239	11.463	0,0%	-3,7%
Total	830.746	57.775	822.098	52.347	-1,0%	-9,4%
2000	Eurostat reference approach		National reference approach		Percentage difference	
	Apparent consumption (TJ)	CO ₂ emissions (Gg)	Apparent consumption (TJ)	CO ₂ emissions (Gg)	Apparent consumption (TJ)	CO ₂ emissions (Gg)
Liquid fossil fuels	497.098	33.554	487.982	31.435	-1,8%	-6,3%
Solid fossil fuels	152.796	14.773	149.283	10.993	-2,3%	-25,6%
Gaseous fossil fuels	273.551	15.057	275.682	14.876	0,8%	-1,2%
Total	923.446	63.383	912.947	57.305	-1,1%	-9,6%

⁶ Minus means that MS-based estimates are lower than the Eurostat-based estimates. MS data exclude emissions from international aviation.

3.6. International bunker fuels

International bunker emissions of the EC inventory are the sum of the international bunker emissions of the MS. A project shared between the Commission (Eurostat and DG Environment), Eurocontrol and EEA has been initiated to improve the quality of the estimates of CO₂ emissions from international aviation.

In a first phase of the project, Eurocontrol, the European Organisation for the Safety of Air Navigation and responsible for the coordination of the European air traffic management

system, provided Eurostat with aggregated air traffic data covering the years 1996-2000. Eurostat has used these data to produce estimates of fuel consumption and emissions of CO, CO₂, hydrocarbons, NO_x and SO₂, split between domestic and international flights. Estimated fuel consumption has been compared with the figures provided in national inventories and with energy statistics for a number of European countries.

The main results of these first investigations are as follows: Estimations of fuel consumption based on European air traffic data are largely compatible with statistics on fuel sold. Similarly, the split between domestic and international fuel consumption as reported in European inventories is largely compatible with traffic-based estimates. The reasons for remaining discrepancies need to be further investigated and may include: (1) the fact that aircrafts do not refuel during every landing and take-off cycle; (2) the inclusion or non-inclusion of overseas territories in the compared data sets.

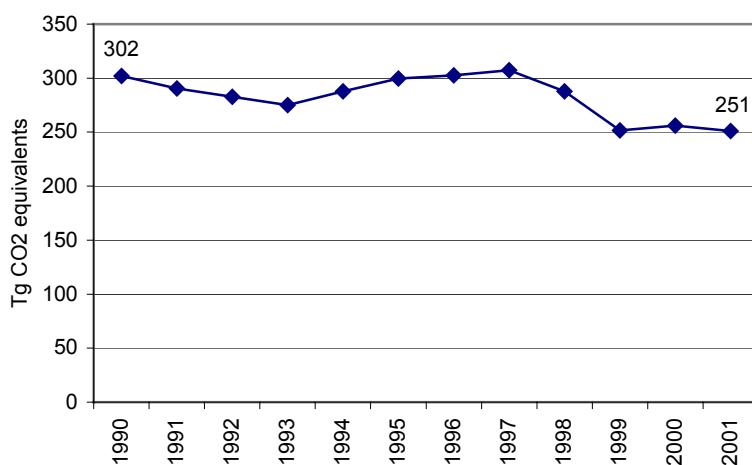

Chapter 4: Industrial processes (CRF sector 2)

This chapter starts with an overview on emission trends in CRF sector 2 ‘Industrial processes’. Then a section on methodological issues and uncertainty presents for each EC key source an overview table which includes the MS contributions to the key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates. In addition, the chapter includes a section on recalculations. A section on sector specific QA/QC is not included as such activities have not yet started in this sector.

4.1. Overview of sector

CRF sector 2 ‘Industrial processes’ is the third-largest sector contributing 6 % to the total EC GHG emissions. The most important GHG from the ‘Industrial processes’ are CO₂ (3 % of the total GHG emissions) and N₂O (1 % of the total GHG emissions). The emissions from this sector decreased by 17 % from 302 Tg in 1990 to 251 Tg in 2001 (Figure 4). In 2001, the emissions decreased by 2 % compared to 2000.

Figure 4: EC GHG emissions 1990-2001 from CRF sector 2 ‘Industrial processes’ in Tg

4.2. Methodological issues and uncertainties

Tables 41-49 present for each EC key source in CRF sector 2 an overview on MS contributions to the key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates. Therefore, the overview tables also aim at making transparent the compilation of CRF Summary Table 3 and CRF Table 7 of the EC submission.

Table 50 provides an overview of emission allocations in the iron and steel production and in the cement production for those MS which provided the relevant information.

Table 50: Energy and process related CO₂ emissions reported in IPCC categories 1A2a, 1A2f, 2A1 and 2C1 (iron and steel industry and cement industry)

	MS reporting	MS explanation	Information source
Austria			
Iron and steel industry	MS reports emissions from 1A2a and 2C1	The emission declaration of the iron and steel industry includes emissions of all activities of this sector which are allocated under SNAP 040202. The standard transformation of SNAP to IPCC allocates the emissions to sector 2C1	Table 1, Table 2(I) and Table 9 (CRF_2002_2001)
Cement industry	MS reports emissions from 2A1	Emissions of cement industry are reported as total emissions and not for the different fuel types.	Table 2(I) and Table 9 (CRF_2002_2001)
Belgium			
Iron and steel industry	MS reports emissions from 1A2a and 2C1	No specific explanation available	Table 1 and Table 2(I) (CRF2001BELG_2003)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (CRF2001BELG_2003)
Denmark			
Iron and steel industry	MS reports that emissions from 1A2a and 2C1 are IE and 0 respectively	Danish energy statistics states energy consumption of manufacturing industry as a whole. Thus all energy consumption of 1A2 is included in 1A2f.	Table 1, Table 2(I) and Table 9 (April 2003_DK2001_UN2)
Cement industry	MS reports emissions from 2A1	Danish energy statistics states energy consumption of manufacturing industry as a whole. Thus all energy consumption of 1A2 is included in 1A2f.	Table 2(I) and Table 9 (April 2003_DK2001_UN2)
Finland			
Iron and steel industry	MS reports emissions from 1A2a MS reports that CO ₂ emissions from 2C1 are included elsewhere (IE)	CO ₂ emissions from C1 'Iron and Steel Production' have been included in 1A2a 'Iron and Steel'. The calculation method gives more accurate total CO ₂ emissions (no double counting, completeness) compared to more or less arbitrary allocation of coke and BF gases between energy use and process use.	Table 1, Table 2(I) and Table 9 (Fi01un03)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (Fi01un03)
France			
Iron and steel industry	MS reports emissions from 1A2a and 2C1	No specific explanation available	Table 1 and Table 2(I) (CRF_France_01)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (CRF_France_01)
Germany			
Iron and steel industry	MS reports that emissions from 1A2a are included elsewhere (IE) MS reports that emissions from 2C1 are not estimated (NE)	No specific explanation available	Table 1 and Table 2(I).A-G (Germany - 2002 - 2001)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (Germany - 2002 - 2001)
Greece			
Iron and steel industry	MS reports emissions from 1A2a MS reports that emissions from 2C1 are 0	No specific explanation available	Table 1 and Table 2(I) (Greece - Submission 2003 - 2001)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (Greece - Submission 2003 - 2001)
Ireland			
Iron and steel industry	MS reports emissions from 1A2a MS reports that emissions from 2C1 are not occurring (NO)	No specific explanation available	Table 1 and Table 2(I).A-G (CRF2001_2003_IE)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (CRF2001_2003_IE)
Italy			
Iron and steel industry	MS reports emissions from 1A2a and 2C1	CO ₂ emissions from pig iron, sinter and coke production are not relevant and considered in the combustion processes	Table 1 and Table 2(I).A-G (CRF-ITA2001)

Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (CRF-ITA2001)
Luxembourg			
Iron and steel industry	Reporting not detailed enough	No specific explanation available	No sectoral (background) tables available
Cement industry	Reporting not detailed enough	No specific explanation available	No sectoral (background) tables available
Netherlands			
Iron and steel industry	MS reports emissions from 1A2a MS reports that emissions from 2C1 are IE	IE in C. 'Metal Production' and in D 'Other Production' are allocated under 1.A.2. 'Manufacturing Industries and Construction'.	Table 1 and Table 2(I) A-G (Netherlands - Submission 2003 v 2.0 - 2001)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (Netherlands - Submission 2003 v 2.0 - 2001)
Portugal			
Iron and steel industry	MS reports emissions from 1A2a and 2C1	No specific explanation available	Table 1 and Table 2(I) (Portugal-2003-2001 v3)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (Portugal-2003-2001 v3)
Spain			
Iron and steel industry	MS reports emissions from 1A2a and 2C1	No specific explanation available	Table 1 and Table 2(I) (Year 2001 - Common Reporting Format V1.01)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (Year 2001 - Common Reporting Format V1.01)
Sweden			
Iron and steel industry	MS reports emissions from 1A2a and 2C1	No specific explanation available	Table 1 and Table 2(I) (SE-2003-2001)
Cement industry	MS reports emissions from 2A1	No specific explanation available	Table 2(I) (SE-2003-2001)
United Kingdom			
Iron and steel industry	MS reports emissions from 1A2a and 2C1	Emissions from blast furnace gas used for energy are reported in 1A2.	Table 1 and Table 2(I) A-G (common_reporting_format_v1.01_uk_2003_01)
Cement industry	MS reports emissions from 2A1	More specific explanation available in National Environmental Technology Centre (2003)	Table 2(I) (common_reporting_format_v1.01_uk_2003_01)

4.3. Sector-specific recalculations

Table 51 shows that in the industrial processes sector the largest recalculations in absolute terms were made for CO₂. In relative terms, the largest recalculations were made for N₂O emissions in the year 2000.

Table 51: Recalculations of total greenhouse gas emissions and recalculations of greenhouse gas emissions in CRF sector 2 ‘Industrial processes’ for the years 1990 and 2000 by gas in Gg and percent

1990	CO ₂		CH ₄		N ₂ O		HFCs		PFCs		SF ₆	
	Gg	percent	Gg	percent	Gg	percent	Gg	percent	Gg	percent	Gg	percent

2000												
Total emissions and removals	4.635	0,15%	-6.581	-1,93%	11.256	3,33%	4.362	-4,76%	-683	-9,98%	810	9,05%
Industrial Processes	-5.820	-3,87%	-24	-5,20%	3.355	7,22%	4.362	-4,76%	-683	-9,98%	810	9,05%

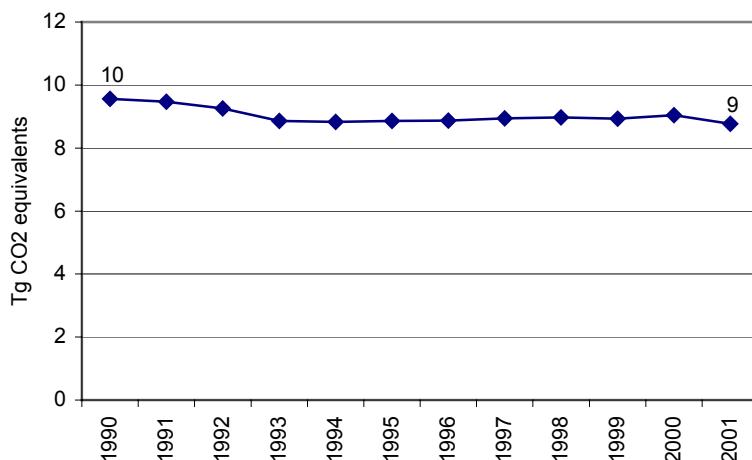

Chapter 5: Solvent and other product use (CRF sector 3)

This chapter provides two short sections on emission trends and on recalculations in CRF sector 3 ‘Solvent and other product use’. No section on methodological issues and uncertainty is included in this chapter because the sector does not contain an EC key source.⁷ Neither is included a section on sector specific QA/QC as no such activities are performed in this sector.

5.1. Overview of sector

CRF sector 3 ‘Solvent and other product use’ contributes less than 1 % of the total EC GHG emissions. The most important GHG from ‘Solvent and other product use’ is CO₂ (0,13 % of the total GHG emissions). The emissions from this sector decreased by 8 % from 10 Tg in 1990 to 9 Tg in 2001 (Figure 5). In 2001, the emissions decreased by 3 % compared to 2000.

Figure 5: EC GHG emissions 1990-2001 from CRF sector 3 ‘Solvent and other product use’ in Tg

5.2. Sector-specific recalculations

Table 52 shows that in the solvent sector only minor recalculations were made (in particular in absolute terms).

Table 52: Recalculations of total greenhouse gas emissions and recalculations of greenhouse gas emissions in CRF sector 3 ‘Solvent and other product use’ for the years 1990 and 2000 by gas in Gg and percent

1990	CO ₂		CH ₄		N ₂ O		HFCs		PFCs		SF ₆	
	Gg	percent	Gg	percent	Gg	percent	Gg	percent	Gg	percent	Gg	percent
Total emissions and removals	-5.604	-0,18%	-12.361	-2,90%	7.999	2,00%	1.242	5,08%	-143	-1,05%	-129	-1,52%
Solvent and other product use	342	5,97%	0	0,00%	152	4,56%	NO	NO	NO	NO	NO	NO
2000												
Total emissions and removals	4.635	0,15%	-6.581	-1,93%	11.256	3,33%	4.362	-4,76%	-683	-9,98%	810	9,05%
Solvent and other product use	212	3,96%	0	0,00%	31	0,90%	NO	NO	NO	NO	NO	NO

⁷ In this report, overview tables on methodologies and on uncertainties are only presented for the EC key sources as identified in Chapter 1.5. For information on sector specific methods used by the MS see MS submissions.

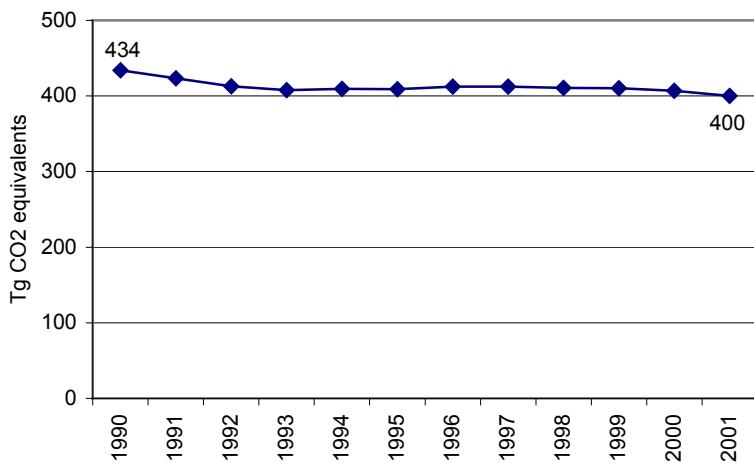

Chapter 6: Agriculture (CRF sector 4)

This chapter starts with an overview on emission trends in CRF sector 4 ‘Agriculture’. Then a section on methodological issues and uncertainty presents for each EC key source an overview table which includes the MS contributions to the key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates. In addition, the chapter provides information on sector specific QA/QC and on recalculations.

6.1. Overview of the sector

CRF sector 4 ‘Agriculture’ contributes 10 % of the total EC GHG emissions, making it the second-largest sector after the sector ‘Energy’. The most important GHG from ‘Agriculture’ are N₂O (5 % of the total emissions) and CH₄ (4 % of the total GHG emissions). Total emissions from this sector decreased by 8 % from 434 Tg in 1990 to 400 Tg in 2001 (Figure 6). In 2001, emissions decreased by 2 % compared to 2000.

Figure 6: EC GHG emissions 1990-2001 from CRF sector 4 ‘Agriculture’ in Tg

6.2. Methodological issues and uncertainties

Tables 53-57 present for each EC key source in CRF sector 3 an overview on MS contributions to the key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates. Therefore, the overview tables also aim at making transparent the compilation of CRF Summary Table 3 and CRF Table 7 of the EC submission.

6.3. Sector-specific QA/QC

The main sector specific QA/QC activity is the project lead by JRC on comparison of methods used by MS for emission calculations and emission projections in the agricultural sector. As a first activity under this project, a workshop on “Inventories and Projections of Greenhouse Gas Emissions from Agriculture” was held at the European Environment Agency in February 2003.

The workshop focused on the emissions of methane (CH₄) and nitrous oxide (N₂O) induced by activities in the agricultural sector, not considering changes of carbon stocks in agricultural soils, but including emissions of ammonia (NH₃). The consideration of ammonia emissions allows the validation of the N₂O emission sources and it further strengthens the link between greenhouse gas and air pollutant emission inventories reported under the UNFCCC, the EC GHG Monitoring Mechanism, the UNECE Long-Range Transboundary Air Pollution Convention, and the EU National Emission Ceiling Directive.

Objectives of the workshop were to compare MS methodologies and to identify and explain the main differences. The longer term objective is to further improve the methods used for inventories and projections in the different Member States and to identify how national and common agricultural policies could be integrated in EU-wide emission scenarios. The workshop will be followed by a project lead by JRC to improve the quality of national (MS) GHG emissions from agriculture and a project by EEA/ETC-ACC to improve reporting of GHG emission projections.

6.4. Sector-specific recalculations

Table 58 shows that in the agriculture sector the largest recalculations in absolute and relative terms were made for CH₄. Also N₂O emissions were recalculated by more than 2 % in both years 1990 and 2000.

Table 58: Recalculations of total greenhouse gas emissions and recalculations of greenhouse gas emissions in CRF sector 4 ‘Agriculture’ for the years 1990 and 2000 by gas in Gg and percent

Chapter 7: LUCF (CRF sector 5)

This chapter starts with an overview on emission removal trends in CRF sector 5 ‘LUCF’. No section on methodological issues and uncertainty is included in this chapter because the sector does not contain an EC key source.⁸ In addition, information on sector specific QA/QC and on recalculations is provided.

7.1. Overview of sector

CRF sector 5 ‘LUCF’ is both a source and a sink of GHG emissions. In 2001, net GHG emissions from LUCF (emissions minus removals) were -196 Tg in the EC (Figure 7), which was -5 % of total EC GHG emissions. They decreased by 6 % from 1990 to 2001 and by 13,5 % from 2000 to 2001. Net GHG emissions from LUCF have been below 1990 levels for the past decade except in the years 1995, 1998 and 2000.

Figure 7: EC net GHG emissions (emissions minus removals) 1990-2001 from CRF sector 5 ‘LUCF’ in Tg

7.2. Sector-specific QA/QC

Emissions and removals from LUCF of the EC are the sum of MS emissions and removals. In accordance with IPCC guidelines, MS use different methodologies, including data collection methods and frequencies, definitions and conversion factors in the estimation of LUCF data.

The EU initiated an action under the intergovernmental framework for European Cooperation in the field of Scientific and Technical Research (COST E21) “Contribution of Forests and Forestry to Mitigate Greenhouse Effects” with the objective to exchange experience and knowledge to improve the quality of GHG inventory compilation for forests in Europe.

⁸ In this report, overview tables on methodologies and on uncertainties are only presented for the EC key sources as identified in Chapter 1.5. In accordance with the IPCC (2000), the LUCF sector is not included in the key source analysis. For information on sector specific methods used by the MS see MS submissions in Annex 5.

In addition, the JRC is working with the MS on a separate complementary project to facilitate the comparability of LUCF estimates. In 2002, the following activities to compare and improve methodologies on the calculations of emissions and removals from LUCF within EU Member States have started:

As a first step, in February 2002 a workshop was organised by JRC on the LUCF reporting, particularly dedicated to carbon emissions and removals in forests. During this workshop, for the LUCF category 5A the following parameters were recognised to be relevant factors contributing to differences in reporting between MS and to the overall uncertainties of the GHG inventories of the sector:

- definition of forest and forest area in the MS national forest inventories (NFI) and components included in the reporting;
- expansion factors from wood volume to (total) carbon mass;
- inclusion of belowground biomass/growth;
- data sources for wood harvest and estimation of soil carbon.

One of the outcomes of the workshop was the set up of a pilot project with a limited number of EC MS to identify differences in reporting of Land-Use, Land-Use Change and Forestry to UNFCCC, and to propose and test possibilities to improve the comparability and quality of inventory data. The main focus of this pilot project is steered upon carbon reporting in IPCC category 5A (changes in forest and other woody biomass stocks), but other categories of the LUCF sector will also be considered (particularly forest soils). The following MS volunteered for participation in the project: Austria, Denmark, Finland, Italy, Sweden and United Kingdom, while Spain and Ireland participated as “observers”.

In December 2002, a workshop was held under this pilot project. The main outcomes as regards main differences identified and possible improvements are as follows:

Identification of differences:

- Forest definitions;
- Biomass expansion factors (BEFs) (different components are included under “stem volume”, the BEF is different for stocks and growth);
- The local use and export/import of wood and the effective reliability of harvest/market statistics.

Possible improvements:

- Homogenous forest definitions, compatible with FAO and maintaining consistencies with past national inventories, were discussed.
- MS reports should include more detailed information on what is included in the BEFs.
- A reliability check of BEFs should be performed. In this respect, a common effort was envisaged. The situation will improve in the future when results from research and inventory efforts will become available (e.g. Finnish work on BEF, 2002-2004)
- The database of wood densities for European tree species should be updated, with country-specific recent data (wood industry can be a data source).

- Efforts should be concentrated on whole mineral soil and peat carbon stocks including the forest floor, as well as on land areas/land use types/land management measures where more rapid and reliably detectable changes can be expected.

7.3. Sector-specific recalculations

Table 59 shows that in the LUCF sector the large recalculations in absolute terms were made for CO₂ in the year 1990.

Table 59: Recalculations of total greenhouse gas emissions and recalculations of net greenhouse gas emissions in CRF sector 5 ‘LUCF’ for the years 1990 and 2000 by gas in Gg and percent

Chapter 8: Waste (CRF sector 6)

This chapter starts with an overview on emission trends in CRF sector 6 ‘Waste’. Then a section on methodological issues and uncertainty presents for each EC key source an overview table which includes the MS contributions to the key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates. In addition, the chapter includes information on recalculations. A section on sector specific QA/QC is not included as such activities have not yet started in this sector.

8.1. Overview of sector

CRF sector 6 ‘Waste’ is the fourth-largest sector in the EC, contributing with CH₄ 2 % of the total GHG emissions in the EC. Both CO₂ and N₂O contribute less than 1 % to the total GHG emissions. Total emissions from ‘Waste’ have been decreasing by 24 % from 135 Tg in 1990 to 103 Tg in 2001 (Figure 8). In 2001, emissions decreased by 1,8 % compared to 2000.

Figure 8: EC GHG emissions 1990-2001 from CRF sector 6 ‘Waste’ in Tg

8.2. Methodological issues and uncertainties

Tables 60-62 present for each EC key source in CRF sector 6 an overview on MS contributions to the key source in terms of level and trend, and information on methodologies, emission factors, completeness and qualitative uncertainty estimates. Therefore, the overview tables also aim at making transparent the compilation of CRF Summary Table 3 and CRF Table 7 of the EC submission.

8.3. Sector-specific recalculations

Table 63 shows that in the waste sector large recalculations were made for CH₄ in absolute and relative terms. For both years 1990 and 2000, CH₄ emissions from waste as provided in this submission are more than 15 % lower than the values provided in the previous submission.

Table 63: Recalculations of total greenhouse gas emissions and recalculations of greenhouse gas emissions in CRF sector 6 ‘Waste’ for the years 1990 and 2000 by gas in Gg and percent

Chapter 9: Other (CRF sector 7)

This chapter provides two short sections on emission trends and on recalculations in CRF sector 7 ‘Other’. No section on methodological issues and uncertainty is included in this chapter because the sector does not contain an EC key source.⁹ Neither is included a section on sector specific QA/QC as no such activities are performed in this sector.

9.1. Overview of sector

CRF sector ‘Other’ is the smallest sector contributing 0,05 % to overall EC GHG emissions. The most important gases from the CRF sector ‘Other’ are N₂O (0,03 % of the total GHG emissions) and CO₂ (0,02 % of the total GHG emissions). Total emissions from ‘Other’ have slightly increased since 1990 (Figure 9).

Figure 9: EC GHG emissions 1990-2001 from CRF sector 7 ‘Other’ in Tg

9.2. Sector-specific recalculations

Table 64 shows that in CRF sector 7 ‘Other’ only minor recalculations were made for 1990 and 2000.

Table 64: Recalculations of total greenhouse gas emissions and recalculations of greenhouse gas emissions in CRF sector 7 ‘Other’ for the years 1990 and 2000 by gas in Gg and percent

1990	CO ₂		CH ₄		N ₂ O		HFCs		PFCs		SF ₆

⁹ In this report, overview tables on methodologies and on uncertainties are only presented for the EC key sources as identified in Chapter 1.5. For information on sector specific methods used by the MS see MS submissions.

Chapter 10: Recalculations and improvements

10.1. Explanations and justifications for recalculations

Table 65 provides an overview of the main reasons for recalculating emissions in the year 1990 for each MS, which provided the relevant information. For each MS those three sources have been identified which had the largest recalculations in absolute terms. In addition, all recalculations of more than 1.000 Gg are presented. For more detailed explanatory information on recalculations see the information provided in the MS submissions in Annex 5.

Table 65: Main recalculations in the EC MS for the year 1990 and MS explanation for recalculations given in the CRF or the inventory report

Spain			
Total emissions excluding LUCF	1.181		
CH ₄ from 4.B. manure management	393	Emission factor sheep, goats and pigs age categories: The ages of certain categories of animals (sheep, goats, pigs) have been changed and this has led to a change in the factor for the excretion of N for some categories in these species. Activity data extensive-intensive pig husbandry: It has been separated into two different censuses for pig herds: one for extensive grazing and another for intensive grazing. This implies a variation in the percentage per province and type of animals in meadow grazing (extensive), thus leading to a variation in the emissions from dung treatments (both CH ₄ and N ₂ O). Activity data sheep and goat age categories: Some of the age categories of sheep and goat herds in the census have been revised. This has resulted in a larger number of restocking lambs and fewer lambs slaughtered. Activity data poultry heads: The algorithm for the calculation of the number of heads of poultry has been revised in accordance with the proposal from the MAPA, thus leading to an increase in their number.	CRF Table 8(b) (Year 1990 - Common Reporting Format V1.01)
CO ₂ from 1.A.1. energy industries	313	Emission factor petroleum refining: In the course of the 2002 data verification process the LHV values for refinery gas from one refinery plant have been revised upwards (by around 15%) as they appeared with abnormally low values for the period 1990-1993. Additional reporting in petroleum refining: The new inventory edition has incorporated the installations for the petrochemical part of one petroleum refinery that was not included in the previous submission.	CRF Table 8(b) (Year 1990 - Common Reporting Format V1.01)
N ₂ O from 4.D. agricultural soils	254	Emission factor: The FRACGASM parameter (fraction of N emitted as NO _x or NH ₃) was amended and it has been decided to calculate it on the basis of the emission factors of NH ₃ and NO _x instead of taking a default value. Activity data crop surface and production: At the date of the close of the previous year, only the Ministry of Agriculture (MAPA) yearbooks up to 1996 were available. A new yearbook has since appeared for 1998 (the one for 1997 has not yet been published) and so the data have been reviewed in the light of this new publication. For subsequent years, the data provided by the MAPA advanced statistical data base. Activity data organic crop fertilization: In view of the difficulties of obtaining a consistent series of historic data for organic crop fertilization with the data from the successive MAPA Good Farming Practices documents, it has been decided to take the 1997 Good Farming Practices for the set of years 1990-2001 included in this inventory.	CRF Table 8(b) (Year 1990 - Common Reporting Format V1.01)

10.2. Implications for emission levels

Table 66 provides the differences of total EC GHG emissions between the latest submission and the previous submission in absolute and relative terms. The table shows that due to recalculations, total EC 1990 GHG emissions excluding LUCF have decreased in the latest submission compare to the previous submission by 15.895 Gg (-0,38 %). In contrast to this, EC GHG emissions for the year 2000 have increased by 7.381 Gg (+0,18 %) due to recalculations.

Table 66: Overview of recalculations of EC total GHG emissions (difference between latest submission and previous submission in Gg CO₂ equivalents and in percent)

	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000
Total CO ₂ equivalent emissions including LUCF (absolute)	-8.996	-11.161	-6.595	4.828	1.795	1.438	8.251	7.714	12.853	11.719	7.186
Total CO ₂ equivalent emissions including LUCF (percent)	-0,22%	-0,28%	-0,17%	0,13%	0,05%	0,04%	0,21%	0,20%	0,33%	0,30%	0,18%
Total CO ₂ equivalent emissions excluding LUCF (absolute)	-15.895	-17.918	-13.048	-1.582	-4.684	-4.942	1.849	1.174	6.298	5.334	7.381
Total CO ₂ equivalent emissions excluding LUCF (percent)	-0,38%	-0,42%	-0,32%	-0,04%	-0,12%	-0,12%	0,04%	0,03%	0,15%	0,13%	0,18%

Table 67 provides an overview of recalculations for the EC key source categories for the years 1990 and 2000 (see Chapter 4.8 for information on identification of EC key sources). The table shows that the largest recalculations in absolute terms were made in the key source categories CH4 from 6.A. ‘Solid Waste disposal on Land’, N2O from 4.D. ‘Agricultural Soils’ and CH4 from 4.B. ‘Manure Management’.

Table 67: Recalculations for the EC key source categories 1990 and 2000 (difference between latest submission and previous submission in Gg of CO₂ equivalents and in percent)

10.3. Implications for emission trends, including series consistency

Figure 10 shows that due to the recalculations the emission trend in the EC has changed slightly. Due to the fact that the 1990 emission have been reduced in the latest submission compared to the previous submission and the 2000 emissions have been increased, the trend 1990-2000 has also changed. In the previous submission the trend of greenhouse gas emissions excluding LUCF between 1990 and 2000 was -3,5 %. In the latest submission this trend has changed to -3 %.

Figure 10: Comparison of EC GHG emission trends 1990-2000 (excl. LUCF) of the latest and the previous submission

10.4. Recalculations, including in response to the review process, and planned improvements to the inventory

Several activities are ongoing at EC level with a view to improve the EC GHG inventory system:

- A proposal for an EU 'Greenhouse gas inventory system' under the Kyoto Protocol has been drafted and discussed in the Monitoring Committee under Council Decision 99/296/EC.
- In 2003, the legal basis of the compilation of the EC inventory and the EC inventory system (Council Decision 99/296/EC) will be revised in order to be fully in accordance with the Kyoto Protocol and the Marrakech Accords of November 2001 and additional implementation provisions will be elaborated.
- A number of sector specific QA/QC activities will continue: Eurostat is working with national statistical offices on harmonisation of energy balance data (see Chapter 3.3). In addition, Eurostat is involved in an EU project on aimed at improving estimates of emissions from international aviation (see Chapter 3.6). The JRC is working with MS on the quality improvement of estimates of emissions and removals from LUCF and from agriculture (see Chapters 7.2 and 6.3 respectively). In addition, the QA/QC activities performed during the compilation process of the EC inventory will be further extended.
- The EEA-ETC will gradually extend and adapt the ETC database in close cooperation with the UNFCCC secretariat in order to include the detailed sectoral emission data submitted by the MS and in order to further extend the EC CRF submission by compiling the relevant sectoral tables at EU level.

Ministry of the Environment, Directorate-General for Environmental Quality and Assessment, Madrid, March 2002

Ministry of the Environment 2003a. *Greenhouse Gas Emissions in Finland 1990-2001. National Inventory Report to the UNFCCC Secretariat. Common Reporting Formats (CRF) 1990-2001*. Helsinki 28 March 2003.

Ministry of the Environment 2003b. *Greenhouse gas emissions inventories report from Spain 1990-2001. Communication to the European Commission (Decision 1999/296/CE)*
Ministry of the Environment, Directorate-General for Environmental Quality and Assessment, Madrid, March 2003

Monni, S. and Syri, S. 2003. *Uncertainties in the Finnish 2001 Greenhouse Gas Emission Inventory*. VTT Research Notes - in preparation.

National Environmental Research Institute 2002. *Denmark's National Inventory Report. Submitted under the United Nations Framework Convention on Climate Change 1990-2000*. Ministry of Environment and Energy, April 2002

National Environmental Technology Centre 2002. *UK Greenhouse Gas Inventory, 1990 to 2000. Annual Report for Annual Report for submission under the Framework Convention on Climate Change*.

National Environmental Technology Centre 2003. *UK Greenhouse Gas Inventory, 1990 to 2001. Annual Report for Annual Report for submission under the Framework Convention on Climate Change*. Final draft, March 2003.

Olivier, J.G.J., Brandes, L.J., Peters, J.A.H.W. and Coenen, P.W.H.G. 2002. *Greenhouse Gas Emissions in the Netherlands 1990-2000. National Inventory Report 2002. EU Summary Report 1990-2000*, RIVM report 773201 006 / 2002.

Olivier, J.G.J., Brandes, L.J. and Coenen, P.W.H.G. 2002. *Greenhouse Gas Emissions in the Netherlands 1990-2001: National Inventory Report 2003. EU Summary Report 1990-2001*. RIVM report 773201 007 – in preparation, December 2002.

Swedish Environmental Protection Agency 2002a. *Sweden's National Inventory Report 2002 - submitted under the United Nations Convention on Climate Change*, April 2002.

Swedish Environmental Protection Agency 2002b. *Sweden's National Inventory Report 2002 - submitted under the United Nations Convention on Climate Change*, December 2002.

Swedish Environmental Protection Agency 2003. *Sweden's National Inventory Report 2003 - submitted under the United Nations Convention on Climate Change*, April 2003.

Units and abbreviations

t	1 tonne (metric) = 1 megagram (Mg) = 10^6 g
Mg	1 megagram = 10^6 g = 1 tonne (t)
Gg	1 gigagram = 10^9 g = 1 kilotonne (kt)
Tg	1 teragram = 10^{12} g = 1 megatonne (Mt)
TJ	1 terajoule

BKB	lignite briquettes
CH ₄	methane
CO ₂	carbon dioxide
COP	Conference of the Parties
CRF	Common Reporting Format
CV	calorific value
DG ENV	European Commission, Directorate-General Environment
EC	European Community
EEA	European Environment Agency
EIONET	European Environmental Information and Observation Network
ETC-ACC	European Topic Centre on Air and Climate Change
EU	European Union
GHG	greenhouse gas
GP _G	Good Practice Guidance
GWP	global warming potential
HFCs	hydrofluorocarbons
JRC	Joint Research Centre
F-gases	fluorinated gases (HFCs, PFCs, SF ₆)
IE	included elsewhere
IPCC	Intergovernmental Panel on Climate Change
KP	Kyoto Protocol
LUCF	land-use change and forestry
LULUCF	land-use, land-use change and forestry
MS	member state
N ₂ O	nitrous oxide
NA	not applicable
NE	not estimated
NIR	National Inventory Report
NO	not occurring
PFCs	perfluorocarbons

QA/QC	quality assurance / quality control
RIVM	National Institute of Public Health and the Environment (The Netherlands)
SF ₆	sulphur hexafluoride
UBA Vienna	Federal Environment Agency Austria
UNFCCC	United Nations Framework Convention on Climate Change

Annex 1: Key sources

This Annex includes the calculation tables for the EC key source categories in order to make the EC key source analysis more transparent. The grey shaded source categories are identified as key sources.

Level assessment for the base year

GREENHOUSE GAS SOURCE CATEGORIES	Gas	Base year (Gg)	Level assessment	Cumulative total
1.A.1. Energy Industries	CO ₂	1.144.434	27,2%	27,2%
1.A.3. Transport	CO ₂	695.003	16,5%	43,8%
1.A.2. Manufacturing Industries and Construction	CO ₂	642.348	15,3%	59,1%
1.A.4. Other Sectors	CO ₂	635.096	15,1%	74,2%
4.D. Agricultural Soils	N ₂ O	214.489	5,1%	79,3%
4.A. Enteric Fermentation	CH ₄	144.091	3,4%	82,7%
6.A. Solid Waste Disposal on Land	CH ₄	110.982	2,6%	85,3%
2.A. Mineral Products	CO ₂	106.934	2,5%	87,9%
2.B. Chemical Industry	N ₂ O	106.096	2,5%	90,4%
1.B.1. Solid Fuels	CH ₄	48.510	1,2%	91,6%
4.B. Manure Management	CH ₄	45.172	1,1%	92,6%
1.B.2. Oil and Natural Gas	CH ₄	32.969	0,8%	93,4%
2 E Production of Halocarbons and SF ₆	HFC	32.373	0,8%	94,2%
2.C. Metal Production	CO ₂	25.702	0,6%	94,8%
4.B. Manure Management	N ₂ O	23.495	0,6%	95,4%
1.A.5. Other	CO ₂	20.076	0,5%	95,8%
1.B.2. Oil and Natural Gas	CO ₂	17.247	0,4%	96,3%
1.A.1. Energy Industries	N ₂ O	14.606	0,3%	96,6%

P = Potential emissions based on Tier 1 approach of the IPCC Guidelines.

A = Actual emissions based on Tier 2 approach of the IPCC Guidelines.

⁽¹⁾ The emissions of HFCs and PFCs are to be expressed as CO₂ equivalent emissions. Data on disaggregated emissions of HFCs and PFCs are to be provided in Table 2(II) of this common reporting format.

⁽²⁾ For verification purposes, countries are asked to report the results of their calculations using the Reference approach and to explain any differences with the Sectoral approach. Where possible, the calculation using the Sectoral approach should be used for estimating national totals. Do not include the results of both the Reference approach and the Sectoral approach in national totals.

⁽³⁾ Other Production includes Pulp and Paper and Food and Drink Production

Note: The numbering of footnotes to all tables containing more than one sheet continue to the next sheet. Common footnotes are given only once at the first point of reference

⁽⁴⁾ According to the IPCC Guidelines (Volume 3. Reference Manual, pp. 4.2, 4.87), CO₂ emissions from agricultural soils are to be included under Land-Use Change and Forestry (LUCF). At the same time, the Summary Report 7A (Volume 1. Reporting Instructions, Tables.27) allows for reporting CO₂ emissions or removals from agricultural soils, either in the Agriculture sector, under D. Agricultural Soils or in the Land-Use Change and Forestry sector under D. Emissions and Removals from Soil. Parties may choose either way to report emissions or removals from this source in the common reporting format, but the way they have chosen to report should be clearly indicated, by inserting explanatory comments to the corresponding cells of Summary 1.A and Summary 1.B. Double-counting of these emissions or removals should be avoided. Parties should include these emissions or removals consistently in Table8(a) (Recalculation - Recalculated data) and Table10 (Emission trends).

⁽⁵⁾ Please do not provide an estimate of both CO₂ emissions and CO₂ removals. "Net" emissions (emissions - removals) of CO₂ should be estimated and a single number placed in either the CO₂ emissions or CO₂ removals column, as appropriate. Please note that for the purposes of reporting, the signs for uptake are always (-) and for emissions (+).

⁽⁶⁾ Note that CO₂ from Waste Disposal and Incineration source categories should only be included if it stems from non-biogenic or inorganic waste streams.

CO₂ Emissions from Biomass	165.707,78														

P = Potential emissions based on Tier 1 approach of the IPCC Guidelines.

A = Actual emissions based on Tier 2 approach of the IPCC Guidelines.

⁽¹⁾ The emissions of HFCs and PFCs are to be expressed as CO₂ equivalent emissions. Data on disaggregated emissions of HFCs and PFCs are to be provided in Table 2(II) of this common reporting format.

⁽²⁾ For verification purposes, countries are asked to report the results of their calculations using the Reference approach and to explain any differences with the Sectoral approach in document box of Table 1.A(c). Where possible, the calculations using the Sectoral approach should be used for estimating national totals. Do not include the results of both the Reference approach and the Sectoral approach in national totals.

⁽³⁾ See footnote 4 to Summary 1.A.

⁽⁴⁾ Please do not provide an estimate of both CO₂ emissions and CO₂ removals. "Net" emissions (emissions - removals) of CO₂ should be estimated and a single number placed in either the CO₂ emissions or CO₂ removals column, as appropriate. Please note that for the purposes of reporting, the signs for uptake are always (-) and for emissions (+).

⁽¹⁾ To convert quantities expressed in natural units to energy units, use net calorific values (NCV). If gross calorific values (GCV) are used in this table, please indicate this by replacing "NCV" with "GCV" in this column.

⁽²⁾ If Anthracite is not separately available, include with Other Bituminous Coal.

TABLE 1.A(c) COMPARISON OF CO₂ EMISSIONS FROM FUEL COMBUSTION
(Sheet 1 of 1)

European Community
 2000
 2003

FUEL TYPES	Reference approach		National approach ⁽¹⁾		Difference ⁽²⁾	
	Energy consumption (PJ)	CO ₂ emissions (Gg)	Energy consumption (PJ)	CO ₂ emissions (Gg)	Energy consumption (%)	CO ₂ emissions (%)
Liquid Fuels (excluding international bunkers)	24.470,37	1.583.005,21	NE	NE	100,00	100,00
Solid Fuels (excluding international bunkers)	8.945,73	854.375,36	NE	NE	100,00	100,00
Gaseous Fuels	14.179,88	782.094,56	NE	NE	100,00	100,00
Other ⁽³⁾	NE	NE	NE	NE		
Total ⁽³⁾	47.595,98	3.219.475,14	NE	3.145.979,51	100,00	2,34

⁽¹⁾ "National approach" is used to indicate the approach (if different from the Reference approach) followed by the Party to estimate its CO₂ emissions from fuel combustion reported in the national GHG inventory.

⁽²⁾ Difference of the Reference approach over the National approach (i.e. difference = 100% x ((RA-NA)/NA), where NA = National approach and RA = Reference approach).

⁽³⁾ Emissions from biomass are not included.

Note: In addition to estimating CO₂ emissions from fuel combustion by sector, Parties should also estimate these emissions using the IPCC Reference approach, as found in the IPCC Guidelines, Worksheet 1-1(Volume 2. Workbook). The Reference approach is to assist in verifying the sectoral data. Parties should also complete the above tables to compare the alternative estimates, and if the emission estimates lie more than 2 percent apart, should explain the source of this difference in the documentation box provided.

Documentation Box:

See chapter 3.5 of the EC Inventory Report 2003.

TABLE 1.A(d) SECTORAL BACKGROUND DATA FOR ENERGY
Feedstocks and Non-Energy Use of Fuels

⁽¹⁾ Where fuels are used in different industries, please enter in different rows.

⁽²⁾ Enter these fuels when they are used as feedstocks.

^(a) The fuel lines continue from the table to the left.

Note: The table is consistent with the IPCC Guidelines. Parties that take into account the emissions associated with the use and disposal of these feedstocks could continue to use their methodology, and provide explanation notes in the documentation box below.

Documentation box: A fraction of energy carriers is stored in such products as plastics or asphalt. The non-stored fraction of the carbon in the energy carrier or product is oxidized, resulting in carbon dioxide emissions, either during the use of the energy carriers in the industrial production (e.g. fertilizer production), or during the use of the products (e.g. solvents, lubricants), or in both (e.g. monomers). To report associated emissions use the above table, filling an extra "Additional information" table, as shown below.

Associated CO ₂ emissions (Gg)	Allocated under (Specify source category) ^(a) <input checked="" type="checkbox"/>	^(a) e.g. Industrial Processes, Waste Incineration, etc.

⁽¹⁾ This table is intended to be used by Parties to summarize their own assessment of completeness (e.g. partial, full estimate, not estimated) and quality (high, medium, low) of major source/sink inventory estimates. The latter could be understood as a quality assessment of the uncertainty of the estimates. This table might change once the IPCC completes its work on managing uncertainties of GHG inventories. The title of the table was kept for consistency with the current table in the IPCC Guidelines.

Note: To fill in the table use the notation key as given in the IPCC Guidelines (Volume 1. Reporting Instructions, Tables. 37)

(1) Fill in the base year adopted by the Party under the Convention, if different from 1990.

(2) See footnote 4 to Summary 1.A of this common reporting format.

(3) Take the net emissions as reported in Summary 1.A of this common reporting format. Please note that for the purposes of reporting, the signs for uptake are always (-) and for emissions (+).

(4) The information in these rows is requested to facilitate comparison of data, since Parties differ in the way they report CO₂ emissions and removals from Land-Use Change and Forestry.

⁽⁶⁾ The information in these rows is requested to facilitate comparison of data, since Parties differ in the way they report GHG emissions and removals from Land-Use Change and Forestry.

⁽⁷⁾ Net emissions.

⁽⁸⁾ The information in these rows is requested to facilitate comparison of data, since Parties differ in the way they report emissions and removals from Land-Use Change and Forestry. Note that these totals will differ from the totals reported in Table Summary2 if Parties report non-CO₂ emissions from LUCF.

TABLE 11 CHECK LIST OF REPORTED INVENTORY INFORMATION⁽¹⁾							
Party:	European Community			Year:	2001		
Contact info:	Focal point for national GHG inventories	Mr. Bernd Gugel					
	Address:	Spittelauer Lände 5, A-1090 VIENNA					
	Telephone:	+43 (1) 31304 5952	Fax:	+43 (1) 31304 5959	E-mail: gugel@ubavie.gv.at		
	Main institution preparing the inventory	EEA / ETC-ACC					
General info:	Date of submission:	15. Apr 03					
	Base years:	1990	PFCs, HFCs, SF ₆ :	1995			
	Year covered in the submission:	2001					
	Gases covered:	CO ₂ , CH ₄ , N ₂ O, HFC, PFC, SF ₆ , NO _x , CO, NMVOC, SO ₂					
Omissions in geographic coverage:
