## Executive Summary

This report - National Inventory Report (NIR) - presents the results of the national emission inventory of greenhouse gases (GHGs) in Poland in 2001. The inventory covers the following GHGs: carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), hydrofluorocarbons - HFCs (HFC-23, HFC-32, HFC-125, HFC-134a, HFC-143a, HFC-152a, HCF227ea, HFC-365mfc and HFC-245fa), perfluorocarbons - PFCs (perfluoromethane (CF<sub>4</sub>), perfluoroethane (C<sub>2</sub>F<sub>6</sub>), perfluorobutane (C<sub>4</sub>F<sub>10</sub>), and sulfur hexafluoride (SF<sub>6</sub>). The following GHG precursors are also reported: carbon monoxide - CO, nitrogen oxides (NO + NO<sub>2</sub>) - NO<sub>x</sub>, non-methane volatile organic compounds - NMVOC and sulfur dioxide - SO<sub>2</sub>.

The national inventory and accompanying tables of Common Reporting Format (CRF), have been prepared in accordance with the UN FCCC Reporting Guidelines on Annual Inventories. Methodologies used to calculate emissions and sinks of GHGs, are in accordance with methods recommended in two basic publications of Intergovernmental Panel on Climate Change - IPCC, namely *Revised 1996 Guidelines for National Greenhouse Gas Inventories*, and *Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories*. According to these guidelines country specific methods have been used where appropriate and give more accurate emission data. Although, national inventory reports in Polish have been compiled since early 1990s, the first Polish NIR, in English, was submitted to UN FCCC Secretariat in 2003. Here, we present and discuss the results of the GHG national inventory for the year 2001. Totals in tables may not sum due to independent rounding.

### Total national GHG emissions

The GHG emissions in base year (1988/1995) and 2001, expressed as CO<sub>2</sub> equivalents, are presented in table ES.1 In 2001 the total national emission of GHG were about 402.11 million tones of CO<sub>2</sub>-eq., excluding GHG emissions and sinks from category 5. (Land use change and forestry). Compared to the base year (1988/1995), the 2001 emissions have decreased by 31.5%.

Table ES.1 National emissions of greenhouse gases for the years base year (1988/1995)-2001. [Gg CO<sub>2</sub> eq.]

Pollutant	Base year	2001	(2001-base)/base
	Emission in CO <sub>2</sub> eq. [Gg]	Emission in CO <sub>2</sub> eq. [Gg]	
CO <sub>2</sub> – net emission (with LUCF)	461 951.16	299 748.75	-0.35
CO <sub>2</sub> – without LUCF	494 885.88	330 818.76	-0.33
CH <sub>4</sub>	49 256.41	38 448.98	-0.22
N <sub>2</sub> O	42 478.82	31 481.41	-0.26
HFCs	26.44	1 073.35	39.59
PFCs	250.18	269.95	0.08
SF <sub>6</sub>	13.15	18.45	0.40
TOTAL without CO <sub>2</sub> from LUCF	586 910.88	402 110.90	-0.31
TOTAL with LUCF	553 976.16	371 040.89	-0.33

\* 1995 is the base year for HFCs, PFCs and SF<sub>6</sub>

### Carbon dioxide emissions

The CO<sub>2</sub> emissions in 2001 were estimated as 330.82 million tones. This is 33.2% lower than in the base year. CO<sub>2</sub> emission was accounted for 82.3% of total GHG emissions in Poland in 2001. The main CO<sub>2</sub> emission source is *Fuel Combustion* (1.A) subcategory. This sector contributed to the total CO<sub>2</sub> emission by 95.58% in 2001. The shares of the main

subcategories were as follows: *Energy industries* – 54.9%, *Manufacture Industries and Construction* – 14.4%, *Transport* – 9.7% and *Other Sectors* – 15.6%. *Industrial Processes* contributed to the total CO<sub>2</sub> emission by 4.1% in 2001. *Mineral Products* (especially *Cement Production*) is the main emission source in this sector. The CO<sub>2</sub> removal in LUCF sector in 2001, was calculated to be approximately 31.1 million tones. It means that app. 8.4% of the total CO<sub>2</sub> emissions are offset by CO<sub>2</sub> uptake by forests.

### **Methane emissions**

The CH<sub>4</sub> emission amounted to 1 830.90 Gg in 2001 i.e. 38.45 million tones of CO<sub>2</sub> equivalents. The contribution of CH<sub>4</sub> to the national total GHG emission was 9.6% in 2001. Three of main CH<sub>4</sub> emission sources include the following categories: *Fugitive Emissions from Fuels, Agriculture and Waste*. They contributed 38.6%, 33.0% and 26.9% to the national methane emission in 2001, respectively. The emission from the first mentioned sector was covered by emission from Underground Mines (26.9% of total CH<sub>4</sub> emission) and Oil and Natural Gas system (11.7% of total CH<sub>4</sub> emission). Waste disposal sites contributed to 17.0% of the methane emission from total CH<sub>4</sub> emission and Wastewater Handling contributed to 9.8% of total CH<sub>4</sub> emission. The emission from *Enteric Fermentation* dominated in *Agriculture* and amounted to app. 24.3% of total CH<sub>4</sub> emission in 2001.

### **Nitrous oxide emissions**

The nitrous oxide emissions in 2001 were 101.55 Gg i.e. 31.48 million tonnes of CO<sub>2</sub> equivalents. The emission was app. 25.9% lower than the respective figure for the base year. The contribution of N<sub>2</sub>O to the national total GHG emission was 7.8% in 2001. The main N<sub>2</sub>O emission sources and its shares in total N<sub>2</sub>O emission in 2001 are as follow: *Agricultural Soils* – 53.7%, *Manure Management* – 20.2%, *Chemical Industry* – 13.8% and *Fuel Combustion* – 8.2%.

### **Hydrofluorocarbons (HFCs) emissions**

The total emission of HFCs in 2001 was 1.07 million tones CO<sub>2</sub> equivalents. The contribution of HFCs to the national total GHG emission in 2001 was relatively low and has been estimated at 0.27%. The emissions of HFCs-gases had increased 41 times between the base year (1995) and 2001. This significant growth in HFCs emission is mainly due to the increase of emission from refrigeration and air conditioning equipment.

### **Perfluorocarbons (PFCs) emissions**

The total emission of PFCs in 2001 was 0.27 million tonnes of CO<sub>2</sub> equivalents. The contribution of PFCs to the national total GHG emission in 2001 was 0.07%. The emission of PFCs had fluctuated to a limited extend, and followed the trends in aluminium production-its main source. The emission changes between 2001 and the preceding years depend on the aluminium production levels (main PFC source) and the use of C4F10 in fire extinguishers

### **Sulfur hexafluoride emissions**

The total emission of SF<sub>6</sub> in 2001 was 0.02 million tones of CO<sub>2</sub> equivalents. The contribution of SF<sub>6</sub> to the national total GHG emission is insignificant, and in 2001 amounted to app. 0.005%. SF<sub>6</sub> emissions in 2001 were by 1.4 times higher than in 1995. Leakage from electrical equipment during its use and production is the main SF<sub>6</sub> emission source.

# **1. Introduction**

## **1.1 Background information on greenhouse gas inventories and climate change**

The report and underlying CRF tables have been prepared according to updated reporting guidelines on annual inventories of the following GHGs: carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), hydrofluorocarbons - HFCs (HFC-23, HFC-32, HFC-125, HFC-134a, HFC-143a, HFC-152a, HCF227ea, HFC-365mfc and HFC-245fa), perfluorocarbons - PFCs (perfluoromethane (CF<sub>4</sub>), perfluoroethane (C<sub>2</sub>F<sub>6</sub>), perfluorobutane (C<sub>4</sub>F<sub>10</sub>), and sulfur hexafluoride (SF<sub>6</sub>). The GHG precursors, in turn, are: carbon monoxide - CO, nitrogen oxides (NO + NO<sub>2</sub>) - NO<sub>x</sub>, non-methane volatile organic compounds - NMVOC and sulfur dioxide - SO<sub>2</sub> (according to document FCCC/SBSTA/2006/9 published on 18.08.2006 following the decision 14/CP.11)

The ultimate goal of the United Nations Framework Convention on Climate Change (UNFCCC) is "...stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system...". The basic evidence for fulfilling UNFCCC obligations is annual inventory made by Parties to the Convention.

## **1.2 A description of institutional arrangement for inventory preparation**

GHG inventory presented below has been compiled by the National Emission Centre (NEC) established in 2000 at the Institute of Environmental Protection in Warsaw. NEC has been commissioned by the Polish Ministry of Environment to carry out inventories for the GHGs and other air pollutants. Since 2006 NEC is located within the National Administrator of Emission Trading Scheme established also in the Institute of Environmental Protection.

When compiling the inventory, NEC have been collaborating with a number of individual experts as well as institutions. Among the latter are: Central Statistical Office (GUS), Agency of Energy Market (ARE), Institute of Ecology of Industrial Areas in Katowice (IETU), Institute of Automobile Transport (ITS) as well as Office for Forest Planning and Management (BULGiL).

## **1.3 Brief description of the process for inventory preparation**

The GHG emission estimates are based on methodologies elaborated by the Intergovernmental Panel on Climate Change (IPCC) and recommended by the UNFCCC, while emissions of indirect gases according to methodology elaborated by UN ECE/EMEP [IPCC 1997, IPCC 2000, IPCC 2003, EEA 2004]. Wherever necessary and possible, domestic methodologies and emission factors have been developed to reflect specific national conditions. The most important features of the inventory preparation and archiving can be briefly summarized in the following way:

- activity data are mostly taken from official public statistics (GUS) or when required data are not directly available, (commissioned) research reports or expert estimates are used instead,
- emission factors for the main emission categories are mostly taken from reports on domestic research; IPCC default data are used in cases where the emission factors are highly uncertain (e.g. N<sub>2</sub>O emissions from animal waste in agriculture, and CH<sub>4</sub> and N<sub>2</sub>O emission from stationary combustion), or when particular source category contribution to national total is insignificant,

- all activity data, emission factors and resulting emission data are stored at NEC database, which is constantly updated and extended to meet the ever changing requirements for emission reporting, with respect to UNFCCC and LTRAP as well as their protocols.

#### **1.4 General description of methodologies and data sources used**

The GHG emissions and removals inventory presented in this report follow the recommended Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories [IPCC 1997], and the IPCC Good Practice Guidance and Uncertainty Management [GPG 2000]. According to these guidelines country specific methods have been used where appropriate giving more accurate emission data especially in case of key categories. For categories where emissions do not occur or are not estimated the abbreviation NE was used in tables. More detail description of methodologies used in Polish GHG inventory are given in sections 3–8.

The calculated emissions can be presented by various combinations of fuels, sources and sectors. The emissions from fuel combustion are calculated by combining the fuel consumption distributed among emission sources and economy sectors with fuel, source, sector and pollutant specific emission factors. The non-combustion emissions are estimated by combining activity data with emission factors. The emission factors are either estimated from measurements or taken from special investigations. If not available domestically, emission factors are taken first of all from IPCC guidelines or other international publications. The emissions of non-CO<sub>2</sub> gases are expressed in units of CO<sub>2</sub> equivalents, based on Global Warming Potentials (GWP), calculated for a time horizon of 100 years [IPCC 1995].

One of the main steps of emission inventorying from the 1.A. *Energy* category, is preparation of energy budgets for each energy carrier. These budgets are prepared based on the national energy balances published by Central Statistical Office and Agency of Energy Market. The tables of the national energy balance include detailed information on the ins and outs of all the energy carriers used in Poland, as well as information on their conversions to other energy carriers and on their direct consumption. The data for international bunker are also assessed.

The example of evaluation of hard coal consumption is given in table 1.1. The examples of the fuel budgets for: coking coal, brown coal (lignite), fuel oil and high-methane and nitrified natural gas are presented in Annex 2. For each fuel, balance data are given both in natural units and in common (energy) units.

Table 1.1 Steam coal consumption

Evaluation of fuel consumption in national combustion processes	Steam coal	
	10 <sup>3</sup> Mg	TJ
In	102 864	2 428 065
From national sources	100 535	2 365 534
1) Indigenous production	100 087	2 355 333
2) Transformation output or return	0	0
3) Stock decrease	448	10 200
Import	2 329	62 531
Out	102 864	2 428 065
National consumption	82 303	1 932 230
1) Transformation input	65 526	1 520 590
a) input for secondary fuel production	13 585	401 497
b) fuel combustion	51 941	1 119 094
2) Direct consumption	16 777	411 640
Non-energy use	1	30
Combusted directly	16 776	411 610
Combusted in Poland	68 716	1 530 704
Stock increase	407	11 963
Export	19 684	532 681
Losses and Statistical differences	471	-48 809
Net Calorific Value	MJ/kg	22.28
CO <sub>2</sub> Emission Factor	kg/GJ	96.60

The data on quantity of the fuel combusted in whole country in a given year are used for calculation of the average net calorific value of the fuel. This calculated net calorific value provides then the basis for the estimation of country specific CO<sub>2</sub> emission factor for the given fuel. The calculations of these CO<sub>2</sub> emission factors for main fuels are based on empirical formulas that apply the relationship between net calorific values and elemental carbon content. The maximum (potential) CO<sub>2</sub> emission from combustion of a given fuel is, in turn, calculated based on the estimated emission factor. It is one of the way of checking the CO<sub>2</sub> emission value, estimated according to sectoral approach.

Basic information on activity data regarding IPCC categories, are usually published in various GUS statistical yearbooks. The activity data that are not available in GUS publications, have been worked out by experts based on studies commissioned by the Ministry of Environment specifically for the GHG emission inventory purposes.

*Energy Statistics* published by Central Statistical Office is the main source of activity data for *Energy* sector. The data on fuel consumption in *Transport* subcategory, including the fuel consumption data for various types of vehicles, are worked out routinely by experts from the Institute of Automobile Transport, as well as the emission factors for road transport.

### 1.5 Brief description of key source methodologies

The source categories in all sectors, are identified to be *key sources* on the basis of their contribution to the total level and/or trend uncertainty in accordance with IPCC Good Practice Guidance [IPCC 2000]. The complete tables with level and trend assessment are given in Annex 1.

## **1.6 Information on the QA/QC plan including verification**

Comprehensive QA/QC system in Poland is still under development but general procedures are in place to ensure appropriate quality of national inventories. Activities underlying the Quality Control procedures within Polish GHG inventory system contain routine and consistent checks to ensure data integrity within entire time series, correctness as well as completeness. Potential errors and omissions are addressed through routinely checks. An extended QC procedure is carried out for higher tier methods including reviews of activity and emission factor data, and methods. Quality Assurance consisting activities aiming at external reviews are performed occasionally under the auspices of Ministry of Environment.

Generally the first draft of the inventory in form of IPCC tables and draft CRF, is usually produced 12-14 months after the end of the given year depending primarily on the availability of required activity data. The most of activity data comes from national statistics undergoing internal revision and checking process before using it in the inventory. But still extensive checks are done in form of consultations with data providers. The consultations cover both correctness of data and their proper interpretation. The most important institutional sources include: Central Statistical Office, Agency of Energy Market, and a number of collaborating individual experts and institutions. Wherever possible various different datasets are used for comparison purposes. All activity data, parameters and factors used for emission estimates for a given year are examined in comparison to entire time series to detect doubtful figures. Outliers are scrutinized in more detail. After the checking period is completed, the final CRF is prepared together with the accompanying report. The CRF Reporter is also used as one of the checking tool for detecting potential errors and omissions within domestic inventory.

## **1.7 General uncertainty evaluation, including data on the overall uncertainty for the inventory totals**

Uncertainty evaluation made for 2001 is based on calculations and national experts judgements/estimations prepared in 2006 as well as opinions expressed by international experts under UNFCCC Secretariat during in-depth review made in 2005. Calculations includes simplified method for sector 5 and for fluorinated gases.

In Annex 5, the estimate of emission uncertainty for the year 2001 using *Tier 1* approach is given. The uncertainty figures varied significantly among various source categories. More details are included in Annexes 5.

## **1.8 General assessment of the completeness**

The Polish GHG emission inventory includes calculation of emissions from all relevant sources that we are aware of. However, there is a number of exceptions. All of them are expected to have a minor effect on the total national GHG emissions. These exceptions are:

in *Energy* sector (*Fugitive Emission from Fuels* only):

- CO<sub>2</sub> and CH<sub>4</sub> from *Solid Fuel Transformation*
- CO<sub>2</sub> from *Coal Mining and Handling*
- some individual processes in *Oil and Natural Gas* systems

in *Industrial Processes*:

- CO<sub>2</sub> from *Asphalt Roofing*
- CO<sub>2</sub> from *Road Paving with Asphalt*
- CH<sub>4</sub> from *Ferroalloys Production*
- CH<sub>4</sub> from *Aluminium Production*

- CO<sub>2</sub> from *Food and Drink Production*
- CH<sub>4</sub> from *Sinter*
- some minor gaps in estimation of the emissions of HFCs, PFCs, SF<sub>6</sub>

in *Agriculture*

- CH<sub>4</sub> from *Agriculture Soils*

in *LULUCF*

- N<sub>2</sub>O from *Forest and Grassland Conversion*
- CO<sub>2</sub> from *Decay*

in *Waste*

- N<sub>2</sub>O from *Industrial Wastewater*
- N<sub>2</sub>O from *Domestic and Commercial Wastewater except Humane Sewage*
- CH<sub>4</sub> from *Waste Incineration*.

## 2. Greenhouse gas emissions and removals in 2001

### 2.1 GHG aggregated emissions

For carbon dioxide, net emission is calculated by subtracting from the total CO<sub>2</sub> emission and removals from category 5. (Land Use Change and Forestry - LUCF). According to IPCC methodology, CO<sub>2</sub> emissions are given with and without contributions from category 5. Also following IPCC, emission of CO<sub>2</sub> from biomass, is not included in the national total.

For non-CO<sub>2</sub> gases, the inventory results can also be presented (table 2.1) in units of CO<sub>2</sub> equivalents by applying values of the so called Global Warming Potentials - GWP. GWP for methane is 21, and for nitrous oxide 310. Carbon dioxide is the main GHG in Poland with the 82.3% share (in 2001), while the methane contributes with 9.6% to the national total. Nitrous oxide contribution is 7.8% and all industrial GHG together contribute 0.3%.

Table 2.1 Greenhouse gas emissions in 2001 in CO<sub>2</sub> eq.

Pollutant	2001	
	Emission in CO <sub>2</sub> eq. [Gg]	Share [ %]
CO <sub>2</sub> – net emission (with LUCF)	299 748.75	
CO <sub>2</sub> – without LUCF.	330 818.76	82.27
CH <sub>4</sub>	38 448.98	9.56
N <sub>2</sub> O	31 481.41	7.83
HFCs	1 073.35	0.27
PFCs	269.95	0.07
SF <sub>6</sub>	18.45	0.005
TOTAL without CO <sub>2</sub> from LUCF	402 110.90	100.0
TOTAL with LUCF	371 040.89	

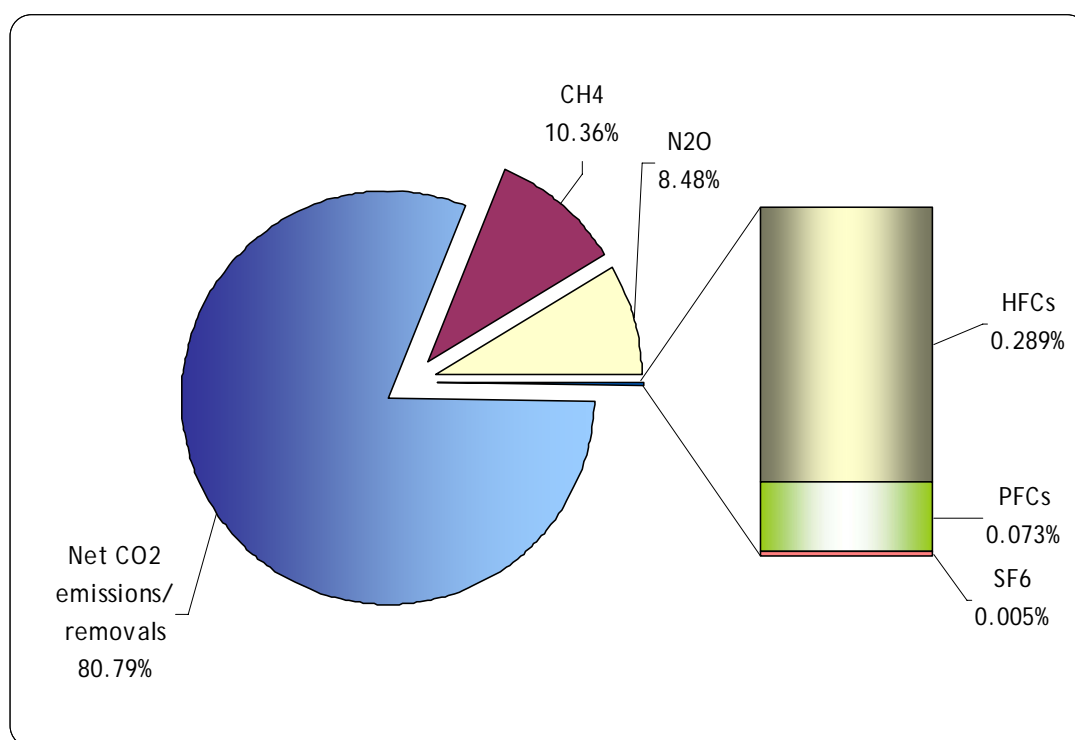

Figure 2.1 Percentage share of greenhouse gases in national total emission total in 2001

Emissions of main GHGs in 2001, disaggregated into main source sub-sectors, are given in table 2.2. Respective values for the industrial gases are presented in table 2.3. Discussion of these results is given in the following section

Table 2.2 Emissions of CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O in 2001 [Gg]

[Gg]	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O

## 2.2 GHG emissions by gas

### Carbon dioxide (CO<sub>2</sub>)

In 2001, the net CO<sub>2</sub> emissions (with LULUCF) were estimated as 299.75 million tonnes, while when sector 5. *LUCF* is excluded the figure reaches 330.82 million tones (table 2.2). The main CO<sub>2</sub> emission source is *Fuel Combustion* (1.A) subcategory. This sector contributed to the total CO<sub>2</sub> emission by 95.58% in 2001. The shares of the main subcategories in 1.A were as follows: *Energy industries* - 54.9%, *Manufacture Industries and Construction* – 14.4%, *Transport* – 9.7% and *Other Sectors* – 15.6%. Sector 2. *Industrial Processes* contributed to the total CO<sub>2</sub> emission by 4.1% in 2001. *Mineral Products* (especially *Cement Production*) is the main emission source in this sector. The CO<sub>2</sub> emission/removal in LULUCF sector in 2001, was calculated to be approximately 31.1 million tonnes. It means that app. 8.4% of the total CO<sub>2</sub> emissions are offset by CO<sub>2</sub> uptake by forests.

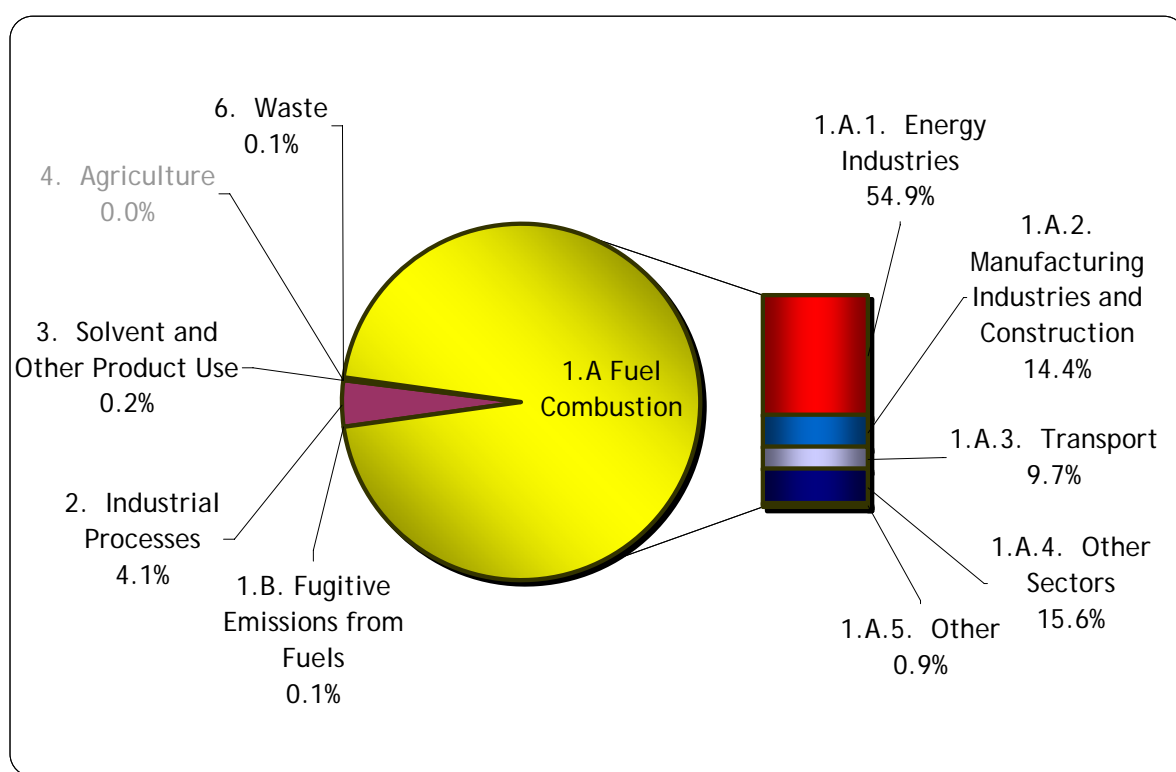

Figure 2.2 Carbon dioxide emission in 2001 by sector

## Methane (CH<sub>4</sub>)

The CH<sub>4</sub> emission amounted to 1 830.90 Gg in 2001 i.e. 38.45 million tones of CO<sub>2</sub> equivalents (table 2.2). Three of main CH<sub>4</sub> emission sources include the following categories: *Fugitive Emissions from Fuels*, *Agriculture* and *Waste*. They contributed to 38.6%, 33.0% and 26.9% of the national methane emission in 2001 respectively. The emission from the first mentioned sector was covered by emission from *Underground Mines* (app. 26.9% of total CH<sub>4</sub> emission) and *Oil and Natural Gas* system (about 11.7% of total emission), *Disposal sites* contributed to 17.03% of the methane emission and *Wastewater Handling* contributed to 9.84%. The emission from *Enteric Fermentation* dominated in *Agriculture* and amounted to app. 24.3% of total methane emission in 2001.

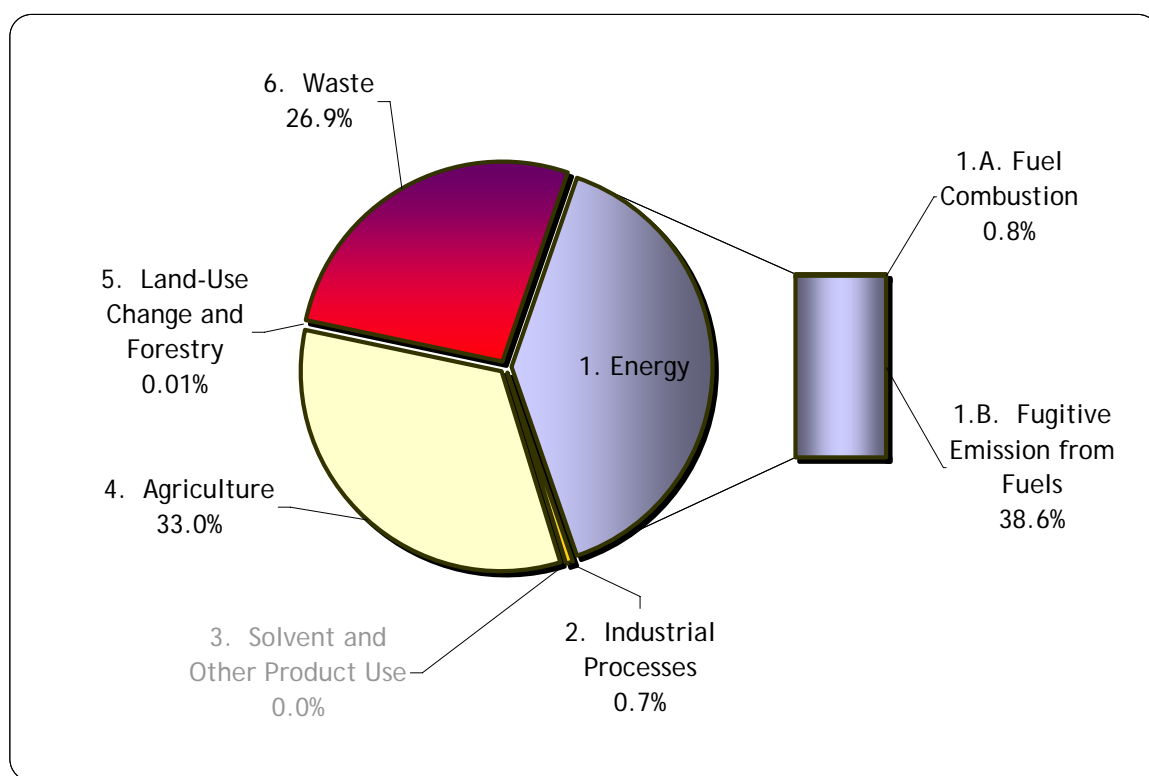

Figure 2.3 Methane emission in 2001 by sector

## Nitrous oxide (N<sub>2</sub>O)

The nitrous oxide emissions in 2001 were 101.55 Gg i.e. 31.48 million tonnes of CO<sub>2</sub> equivalents (table 2.2). The main N<sub>2</sub>O emission sources and its shares in total N<sub>2</sub>O emission in 2001 are: *Agricultural Soils* – 53.7%, *Manure Management* – 20.2%, *Chemical Industry* – 13.8% and *Fuel Combustion* – 8.2%.

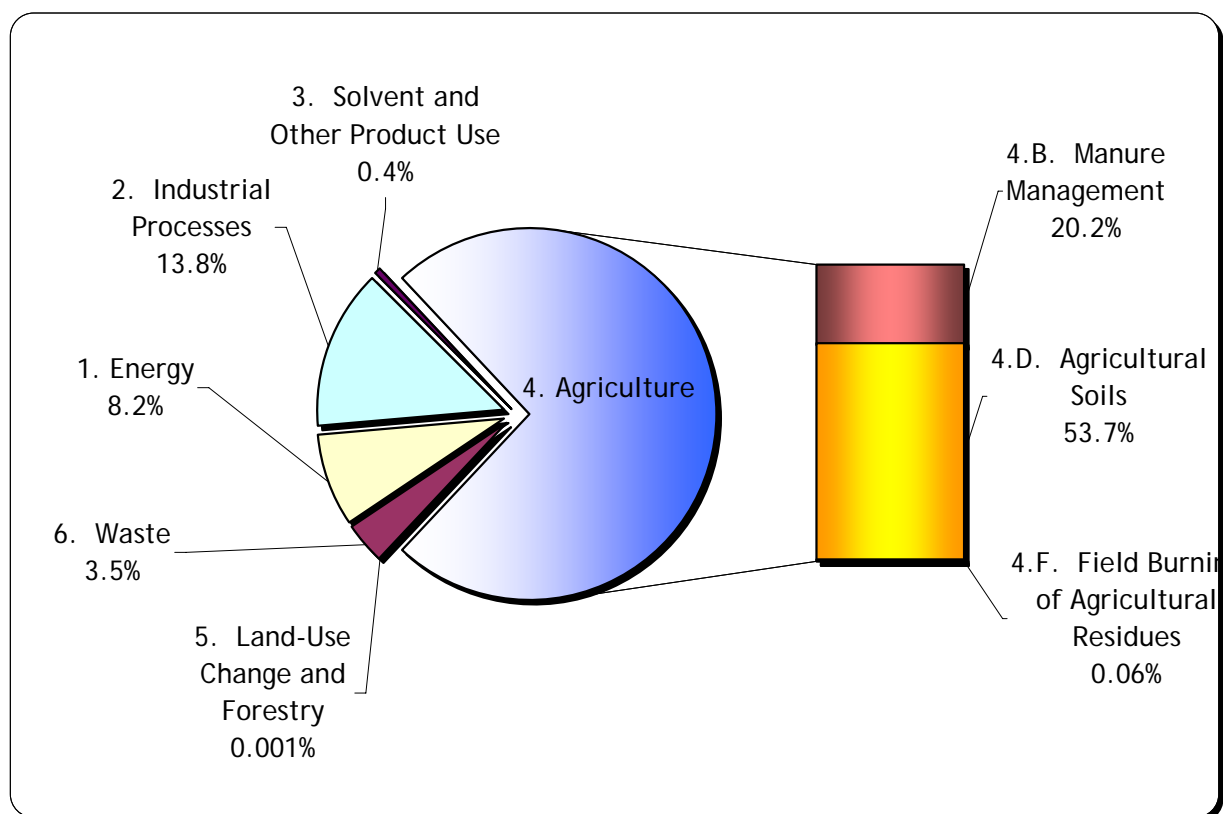

Figure 2.4 Nitrous oxide emission in 2001 by sector

## Industrial gases

The total emission of HFCs in 2001 was 1.07 million tonnes of CO<sub>2</sub> equivalents. The emissions of HFCs-gases had increased 41 times between the base year (1995) and 2001. This significant growth of HFCs emission in recent years is mainly due to the increase of emission from refrigeration and air conditioning equipment.

The total emission of PFCs in 2001 was 0.27 million tonnes of CO<sub>2</sub> equivalents. The emissions of PFCs-gases had increased by 7.9% between the base year (1995) and 2001. It is due to the growth in aluminium production and in the use of C<sub>4</sub>H<sub>10</sub> for manufacturing of fire extinguishers. The emission of PFCs had fluctuated to a limited extent in recent years, and basically followed the trends in aluminium production - its main source.

The total emission of SF<sub>6</sub> in 2001 was 0.02 million tonnes of CO<sub>2</sub> equivalents. SF<sub>6</sub> emissions in 2001 were by 1.4 time higher than in 1995. Leakage from electrical equipment, is the main SF<sub>6</sub> emission source. Insignificant emission of SF<sub>6</sub> occurs during production of soundproof windows.

Large percentage increase of industrial F-gas emissions, compared to the base year, does not influence significantly the national total GHG emission trend, because all the industrial gases together contributed merely 0.3% to national total in 2001.

## 2.3 GHG emissions by category

Here emissions of greenhouse gases are presented from all categories except sector 5. LULUCF described in section 7.

Table 2.5. GHG emissions according to main sectors in base year (1988/1995) and 2001

	Total [Gg eq. CO <sub>2</sub> ]		(2001-base)/base
	Base year	2001	
TOTAL with LUCF	553 976.2	371 040.89	-0.33
TOTAL without LUCF	586 902.6	402 107.62	-0.31
1. Energy	497 964.7	334 152.41	-0.33
2. Industrial Processes	27 356.2	19 448.20	-0.29
3. Solvent and Other Product Use	1 006.5	637.21	-0.37
4. Agriculture	52 378.1	35 996.21	-0.31
5. Land-Use Change and Forestry	-32 926.5	-31 066.73	-0.06
6. Waste	8 197.2	11 873.59	0.45

### 2.3.1 Energy (IPCC category 1)

The emission of GHGs from *Energy* sector in 2001 was 334.2 million tons of CO<sub>2</sub> equivalent. CO<sub>2</sub> emission share exceeded 94.7% of the total GHG emissions within 1.*Energy* category (table 2.6). The most emission intensive category was 1.A.1.*Fuel combustion activities* related mostly to heavy industry sector, highly energy consuming.

Table 2.6. GHG emissions from sub-sectors in category *Energy* in 2001

GHG emission categories	GHG Emission [Tg CO <sub>2</sub> -eq]	% share in the total emission from Energy	% Share in total GHG emission from a given sub-sector		
			CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O
Total Energy	334 152.41	100.0	94.7	4.5	0.8
A. Fuel Combustion	319 094.22	95.5	94.6	0.1	0.8
1. Energy Industries	182 571.79	54.6	54.4	0.0	0.2
2. Manufacturing Industries and Construction	47 925.30	14.3	14.3	0.0	0.1
3. Transport	33 210.38	9.9	9.6	0.0	0.3
4. Other Sectors	52 336.89	15.7	15.5	0.0	0.1
5. Other	3 049.87	0.9	0.9	0.0	0.0
B. Fugitive Emissions from Fuels	15 058.19	4.5	0.1	4.4	0.0
1. Solid Fuels	10 350.50	3.1	0.0	3.1	0.0
2. Oil and Natural Gas	4 707.69	1.4	0.1	1.3	0.0

### 2.3.2 Industrial Processes and Solvent and Other Use (IPCC categories 2 and 3)

Table 2.7 shows detailed information on emissions of CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O in *Industrial Processes* sector and in *Solvent and Other Use* sector in 2001. CO<sub>2</sub> is dominating among GHGs – it's contribution exceeds 69.3%. The main GHG emission sources in this category were: production processes of cement, nitric acid and ammonia.

The emissions of GHG from *Solvent and Other Use* sector includes N<sub>2</sub>O emissions from anaesthesia (19.5%) and CO<sub>2</sub> emissions (recalculated from NMVOC) (80.5%).

Table 2.7. The emissions of CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O from sub-sectors in category *Industrial Processes* and in category *Solvents and Other Product Use* in 2001

GHG emission categories	GHG Emission [Tg CO <sub>2</sub> -eq]	% share in the total emission from Industrial Processes	% Share in total GHG emission from a given sub-sector			
			CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O	HFC, PFC and SF <sub>6</sub>
Total Industrial Processes	19 448.20	100.0	69.3	1.4	22.4	7.0
A. Mineral Products	6 949.90	35.7	35.7	0.0	0.0	
B. Chemical Industry	7 767.70	39.9	16.4	1.1	22.4	
C. Metal Production	3 616.00	18.6	17.1	0.2	0.0	1.3
D. Other Production	NE	NE				
F. Consumption of Halocarbons and SF <sub>6</sub>	1 114.60	5.7				5.7
G. Other	0.00	0.0				
Total Solvent and Other Product Use	637.21	100	80.5	0.0	19.5	

### 2.3.3 Agriculture (IPCC category 4)

The main sources of GHG in category 4. *Agriculture* were: 4.D. *Agricultural Soils*, 4.B. *Enteric Fermentation* and 4.A. *Manure Management* (table 2.8). N<sub>2</sub>O emission share was largest in total GHG emission from *Agriculture* in 2001 and came from both – direct (mineral and organic fertilisation) and indirect (volatilisation, leaching and runoff from applied synthetic fertiliser and animal manure) N<sub>2</sub>O emissions from soils.

Table 2.8. GHG emissions from sub-sectors in category 4. *Agriculture* in 2001

GHG emission categories	GHG Emission [Tg CO <sub>2</sub> -eq]	% share in the total emission from Agriculture	% Share in total GHG emission from a given sub sector	
			CH <sub>4</sub>	N <sub>2</sub> O
Total Agriculture	35 996.21	100.0	35.3	64.7
A. Enteric Fermentation	9 345.33	26.0	26.0	0.0
B. Manure Management	9 687.12	26.9	9.2	17.7
D. Agricultural Soils	16 918.41	47.0	0.0	47.0
F. Field Burning of Agricultural Residues	45.35	0.1	0.1	0.1

### 2.3.4 Waste (IPCC category 6)

As it can be seen in table 2.9, the emission of CH<sub>4</sub> dominated in this sector in 2001 (almost 87.0%). The main part of GHG emissions came from *solid waste disposal on land* and *wastewater handling*.

Table 2.9. GHG emissions from sub-sectors in category 6. *Waste* in 2001

GHG emission categories	GHG Emission [Tg CO <sub>2</sub> -eq]	% share in the total emission from Waste	% Share in total GHG emission from a given sub-sector		
			CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O
Total Waste	11 873.59	100	3.6	87.0	9.3
A. Solid Waste Disposal on Land	6 548.23	55.1	0.0	55.1	0.0
B. Wastewater Handling	4 856.99	40.9	0.0	31.9	9.0
C. Waste Incineration	468.36	3.9	3.6	0.0	0.3

## 2.4 Comparison to base year (1988/1995)

The data for the GHGs and for the national total GHG emission are given in table 2.10.

Table 2.10 Changes of greenhouse gas emissions in 2001 with respect to base year 1988/1995

Pollutant	Base year	2001	2001/base year [%]
	Emission in CO <sub>2</sub> eq. [Gg]	Emission in CO <sub>2</sub> eq. [Gg]	
CO <sub>2</sub> – net emission (with LUCF)	461 951.16	299 748.75	64.89
CO <sub>2</sub> – without LUCF.	494 885.88	330 818.76	66.85
CH <sub>4</sub>	49 256.41	38 448.98	78.06
N <sub>2</sub> O	42 478.82	31 481.41	74.11
HFCs	26.44	1 073.35	4059.37
PFCs	250.18	269.95	107.90
SF <sub>6</sub>	13.15	18.45	140.36
TOTAL without CO <sub>2</sub> from LUCF	586 910.88	402 110.90	68.51
TOTAL with LUCF	553 976.16	371 040.89	66.98

\* for industrial gases: HFC, PFC and SF<sub>6</sub> the base year is 1995

### Carbon dioxide

CO<sub>2</sub> emission had decreased by app. 33.2% from the base year to 2001.

The following changes took place in the structure of fuel use:

- share in of solid fuels decreased from 85.3% in 1988 to 74.7% in 2001
- share of liquid fuels increased from 11.4% (1988) to 19.6% (2001)
- share of gaseous fuels increased from 3.3% (1988) to 5.7% (2001).

### Methane

CH<sub>4</sub> emission had decreased by app. 21.9% from the base year to 2001. The reasons for that are as follow:

- the decrease in emission from *Enteric Fermentation* by 41.4%
- the decrease in *Fugitive Emission* by 34.6%
- the increase in emission from *Waste* by 60.1%.

### Nitrous oxide

The nitrous oxide emissions in 2001 were app. 25.9% lower than the respective figure for the base year. The share in *Manure Management* decreased from 22.0% in 1988 to 20.2% in 2001, in *Agricultural Soils* decreased from 55.6% (1988) to 53.7% (2001) and in *Chemical Industry* increased from 11.8% in 1988 to 13.8% in 2001.

**Industrial gases: HFCs, PFCs and SF<sub>6</sub>**

HFCs emissions in 2001 were 41 times higher than in 1995. This significant growth in HFCs emission is mainly due to the increase in emission from refrigeration and air conditioning equipment.

PFCs emissions in 2001 were 7.9% higher than in base year (1995). The PFCs emission changes between 2001 and the preceding years depend on the aluminium production levels (main PFC source) and the use of C4F10 in fire extinguishers.

SF<sub>6</sub> emissions in 2001 were about 1.4 times higher than in 1995. Leakage from electrical equipment during its use and production is the main SF<sub>6</sub> emission. Large percentage increase of industrial gases emissions, compared to the base year, does not influence significantly the national total GHG emission trend, because all the industrial gases together contribute merely app. 0.3% to the national total in 2001.

**Emissions of greenhouse gases in base year (1988/1995) in CO<sub>2</sub> equivalent**

Shares of individual GHGs to national total in base year (1988/1995) are presented in Table 2.11 and Figure 2.5 Compared to 1988/1995, the percentage share of CO<sub>2</sub> in 2001 decreased from 84.3% to 82.3%.

Table 2.11 Emissions of greenhouse gases in base year (1988/1995) in CO<sub>2</sub> equivalent

Pollutant	base year 1988 (1995)	
	Emission in CO <sub>2</sub> eq. [Gg]	Share [ %]
CO <sub>2</sub> – net emission (with LUCF)	461 951.16	
CO <sub>2</sub> – without LUCF.	494 885.88	84.3
CH <sub>4</sub>	49 256.41	8.4
N <sub>2</sub> O	42 478.82	7.2
HFCs	26.44	0.0045
PFCs	250.18	0.0426
SF <sub>6</sub>	13.15	0.0022
TOTAL without CO <sub>2</sub> from LUCF	586 910.88	100.0
TOTAL with LUCF	553 976.16	

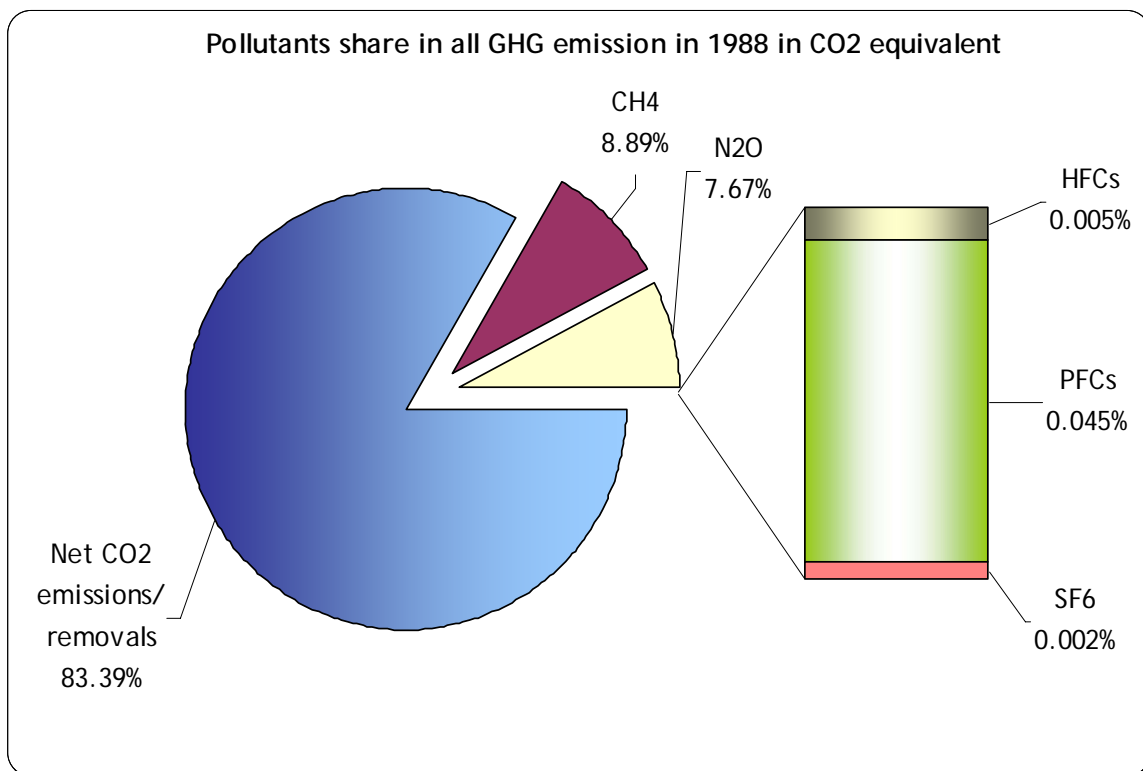

Figure 2.5 Percentage share of national greenhouse gas emissions in base year (1988/1995) including emission from sector 5.

## 2.5 Comparison of greenhouse gas emissions 2001 and 2000

Changes of national emissions and sinks of GHGs in 2001 compared to 2000 were:

CO <sub>2</sub>	- net emission fall to	98.21%
CH <sub>4</sub>	- emission fall to	97.01%
N <sub>2</sub> O	- emission rise to	100.38%
HFC [eq. CO <sub>2</sub> ]	- actual emission rise to	180.50%
PFC [eq. CO <sub>2</sub> ]	- actual emission rise to	120.30%
SF <sub>6</sub> [eq. CO <sub>2</sub> ]	- actual emission rise to	113.20%

Below results are discussed separately for each greenhouse gas with respect to 2001 emissions and change between 2001 and 2000.

## Carbon dioxide (CO<sub>2</sub>)

In 2001, the net CO<sub>2</sub> emissions (with LULUCF) was 1.8% lower than in 2000. The CO<sub>2</sub> emission in 2001 from category *Energy* was higher by 0.2% and from category *Industrial Processes* was lower by 18.1% than in 2000. In comparison to 2000 the CO<sub>2</sub> emission from category *Waste* in 2001 fall by 3.7%.

Table 2.12. Comparison of carbon dioxide emission in 2000 and 2001

Year	CO <sub>2</sub> [Gg]		2001/2000 [%]

## Methane (CH<sub>4</sub>)

The emission in 2001 was lower than in 2000 by 3.0%. The main sources are *Agriculture*, *Energy* and *Waste*. Emission from *Manure Management* in the *Agriculture* sector was lower by 0.6% in 2001 and from *Waste* sector was higher by 0.8% than in 2000. *Fugitive emission* in *Energy* sector was lower by 5.5% in 2001 compared to 2000.

Table 2.13 Comparison of methane emission in 2000 and 2001

## Nitrous oxide (N<sub>2</sub>O)

The emission was higher than in 2000 (by 0.4%). The main sources of N<sub>2</sub>O emission are *Manure Management* and *Agricultural Soils*. Emission from *Manure Management* in the *Agriculture* sector was lower by 1.5% in 2001 and from *Agricultural Soils* was higher by 0.9% than in 2000.

Table 2.14. Comparison of nitrous oxide emission in 2000 and 2001

## Industrial gases

The total emission of HFCs in 2001 by 80.5% higher than in 2000. PFCs emissions in 2001 were by app. 20.3% higher than in 2000. SF<sub>6</sub> emissions in 2001 were by 13.2% higher than in 2000.

## 2.6 Emission trends for indirect greenhouse gases (CO, NO<sub>x</sub> and NMVOC) and SO<sub>2</sub>

Precursors of greenhouse gases e.g. NO<sub>x</sub>, CO and non-methane volatile organic compounds - NMVOC, through their influence on the greenhouse gases, have an indirect effect on climate. The presence of SO<sub>2</sub> in the atmosphere influences the climate by increasing the number of secondary aerosols, which have been found to have a cooling effect. Figures 2.6-2.9 shows trends of emissions of SO<sub>2</sub>, NO<sub>x</sub>, NMVOC (1980-2005) and CO (1990-2005). Emissions of SO<sub>2</sub> decreased by 70% between 1980 and 2005, and 62% between 1990 and 2005. Most of the reductions were caused by the decline of the heavy industry in the late 1980s and early 1990s. In late 1990s the emissions declined because of the diminished share of coal (hard and brown) among fuels used for power and heat generation.

Emissions of NO<sub>x</sub> decreased by 33% between 1980 and 2005, and 36% between 1990 and 2005. Similar to sulphur dioxide, most of the reductions were caused by the decline of the heavy industry and lower share of coal in the late 1980s and early 1990s. Increasing emissions from road traffic contribute to the national total, and cause comparatively lower emission reductions than in case of SO<sub>2</sub>. Emissions of NMVOC decreased by 44% between 1980 and 2002, and 30% between 1990 and 2005. In 1981, there was a drop of NMVOC emission compared to 1980, but already in 1983 emissions began to grow and reached the maximum in 1988 - 1989. In 1990, there was a significant decrease of emissions, followed by a period of fairly stable emissions until 1997. Then the emissions began to fall again until the year 2001. From 1990 to 2005 the emissions of CO have decreased by 55%, mainly because of the same reasons as the described above decline in emissions of SO<sub>2</sub> and NO<sub>x</sub>.

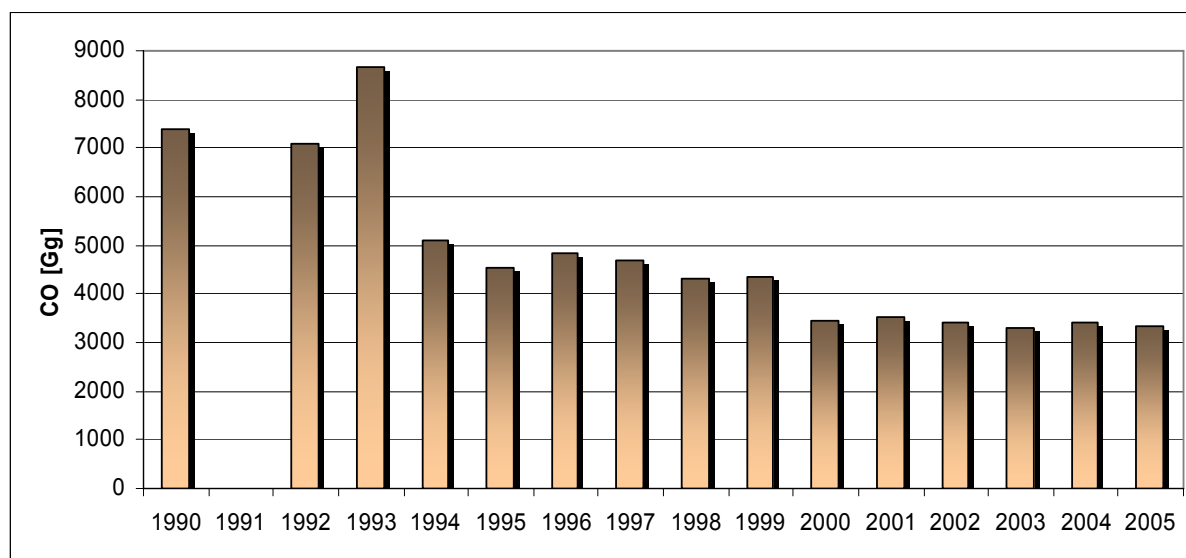

Figure 2.6 Emissions of CO (1990-2005).

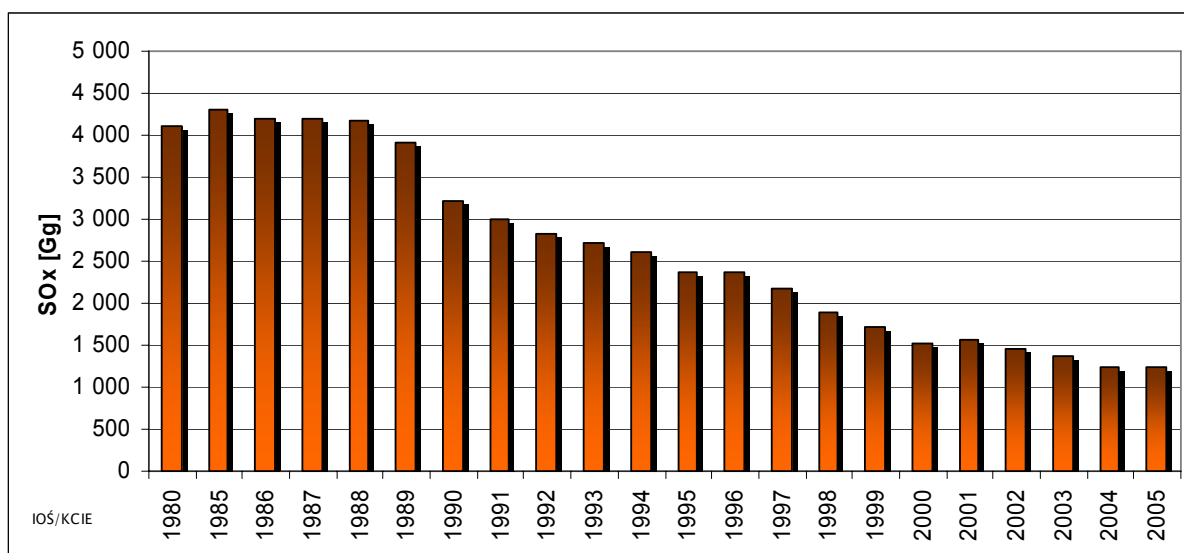

Figure 2.7 Emissions of SO<sub>x</sub>, (1980-2005).

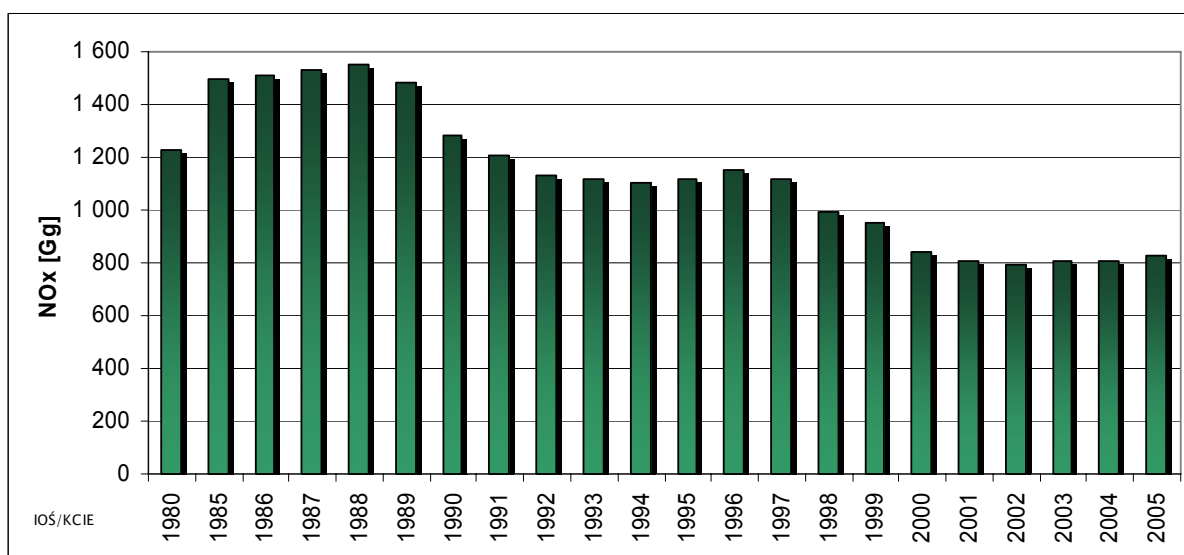

Figure 2.8 Emissions of NO<sub>x</sub>, (1980-2005).

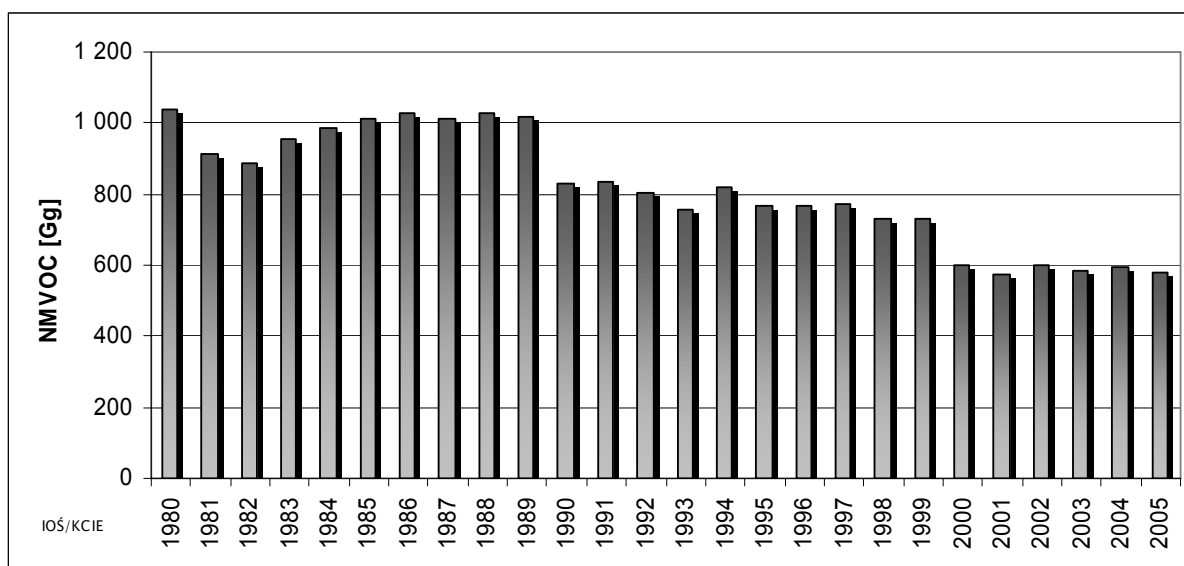

Figure 2.9 Emissions of NMVOC (1980-2005).

### 3. Energy (CRF sector 1)

#### 3.1 Key categories

Following categories from sector 1 have been identified as key sources:

- 1.A.1, 1.A.2, 1.A.4, 1.A.5.a Stationary combustion of solid, liquid and gaseous fuels (CO<sub>2</sub> emission), share in total GHG emission 70.7%
- 1.A.3.b Transport Road Transportation (CO<sub>2</sub> emission), share in total GHG emission 7.4%
- 1.B.1.a. Coal Mining and Handling (CH<sub>4</sub> emission), share in total GHG emission 2.6%
- 1.B.2.b. Natural Gas (CH<sub>4</sub> emission), share in total GHG emission 1.1%

Share of these categories in total Poland's GHG emissions is 81.8%.

#### 3.2 Methodological issues

##### 3.2.1. Fuel combustion (CRF 1.A)

##### *3.2.1.1. Fuel combustion – Sectoral Approach (CRF 1.A.a)*

Combustion as a source of GHG emission occurs in the following category groups:

- 1.A.1. Energy industries
- 1.A.2. Manufacturing industries and construction
- 1.A.3. Transport
- 1.A.4. Other sectors:
  - a. commercial/institutional
  - b. residential
  - c. agriculture/forestry/fishing
- 1.A.5. Other:
  - a. stationary
  - b. mobile

Inventory methodology for **all stationary sources** assumes GHG emission estimation from fuel combustion on the level determined as *Tier 2* and is based on the simple formula:

$$E = \sum (EF_{abc} * A_{abc})$$

where: E - emission

EF - emission factor

A - fuel consumption

a - fuel type, b - sector, c - combustion technology

The national methodology as a primary step introduces preparation of balance spreadsheets, for each fuel. In the spreadsheet, the final calculation leads to the estimation of country specific average net calorific value (NCV) and calculation of elemental C content in the fuel - C<sub>max</sub>, the maximum emission factor for CO<sub>2</sub>. Description and examples of balance spreadsheets are given in chapter 1.4 and Annex 2.

### *Fraction of oxidised carbon*

- gas – 0.995
- oil and oil products – 0.99
- coal – depending on technology of combustion:
  - pulverised coal - 0.984
  - travelling grate stocker – 0.946 – 0.973
  - underfeed stocker – 0.934 - 0.960
  - domestic open fire – 0.988 - 0.994
  - shallow bed AFBC (Advanced Fluidised Bed Combustion) - 0.960
  - Circulating Fluidised Bed Combustion – 0.970
  - Pressurised Fluidised Bed Combustion – 0.970

Fraction of carbon oxidised for hard coal – values for individual sub-sectors (these value have been selected basing on the estimation of share of combustion technology mentioned above):

- 0.984 for *Public thermal plants* and *Public heat plants*
- 0.973 for: *Autoproducing thermal plants*, *Non-public heat plants*, *Boilers in public thermal plants* and for fuel combustion in industry sectors
- 0.988 for *Commercial / Institutional*, *Residential*, *Agriculture / Forestry* sectors

Fraction of carbon oxidised for coke and lignite – like in the case of hard coal

### *Emission factors for fuel combustion in stationary sources*

Maximum emission factors for elemental carbon were determined for major fuels in the form of formulas dependent on net calorific values - NCV, obtained with regression analysis of the results of country measurements. The following formulas were obtained:  
the emission factor for elemental carbon from hard coal:

$$C_{hc} = 10(2.4858 * NCV + 3.3132) / NCV$$

where:  $C_{hc}$  emission factor for hard coal [kg C/GJ],  
NCV- net calorific value of hard coal [MJ/kg],

the emission factor for elemental carbon from brown coal (lignite):

$$C_{bc} \text{ [kg C/GJ]} = 10(1.9328 * NCV + 10.067) / NCV$$

where:  $C_{bc}$  emission factor for brown coal [kg C/GJ],  
NCV- net calorific value of brown coal [MJ/kg],

the emission factor for elemental carbon from coke and semi-coke:

$$C_c \text{ [kg C/GJ]} = 53.139 - 0.811 * NCV$$

where:  $C_c$  emission factor for coke [kg C/GJ],  
NCV- net calorific value of coke [MJ/kg],

the emission factor for elemental carbon from motor gasoline and diesel oil (this formula does not apply to mobile sources):

$$C_{gdo} [\text{kg C/GJ}] = 28.03333 - 0.192 * \text{NCV}$$

where:  $C_{gdo}$  emission factor for gasoline or diesel oil [kg C/GJ],  
 NCV- net calorific value of gasoline or diesel oil [MJ/kg],

the emission factor for elemental carbon from fuel oil:

$$C_{fo} [\text{kg C/GJ}] = 39.7549 - 0.450 * \text{NCV}$$

where:  $C_{fo}$  emission factor for fuel oil [kg C/GJ],  
 NCV- net calorific value of fuel oil [MJ/kg],

the emission factor for high-methane natural gas:

$$C_{hmng} [\text{kg C/GJ}] = 24.9018 - 0.2843 * \text{NCV}$$

where:  $C_{hmng}$  emission factor for high-methane natural gas [kg C/GJ],  
 NCV- net calorific value of fuel oil [MJ/m<sup>3</sup>],

the emission factor for nitrified natural gas:

$$C_{nng} = 15.0 [\text{kg C/GJ}]$$

The following formula was derived for the emission factor for elemental carbon from city gas:

$$C_{cg} [\text{kg C/GJ}] = 10.678 - 0.029 * \text{NCV}$$

where:  $C_{cg}$  emission factor for city gas [kg C/GJ],  
 NCV- net calorific value of city gas [MJ/m<sup>3</sup>].

Finally, following formula was derived for the emission factor for elemental carbon from blast furnace gas:

$$C_{bfg} [\text{kg C/GJ}] = 115.5 - 13.43 * \text{NCV}$$

where:  $C_{bfg}$  emission factor for blast furnace gas [kg C/GJ]  
 NCV- net calorific value of blast furnace gas [MJ/m<sup>3</sup>].

Calculation of the CO<sub>2</sub> emission factor, when the  $C_{max}$  [kg C/GJ] is already known is done with the following formula:

$$EF_{abc} = C_{max} * 44/12 * FO_{abc} [\text{kgCO}_2/\text{GJ}]$$

where:  $C_{max}$  - maximum content of elemental carbon in fuel [kg C/GJ]  
 $FO_{abc}$  - carbon oxidation factor in combustion processes dependent on fuel type and combustion technology

CO<sub>2</sub> emission factors for main fuels are calculated for each sub-category basing on formulas given above. NCV of fuel, which is applied in formula, is calculated basing on statistical data for this fuel consumption expressed in TJ and in natural units. Suitable carbon oxidation

factor value for individual sub-category is selected according to information given above. In some cases aggregation of estimated emission data from detailed sub-sectors is necessary for full-filling of relevant CRF tables. For example, aggregation is needed in 1.A.1.a sub-category where emissions are calculated for each type of energy production plants separately, according to applied national methodology of inventory.

For CH<sub>4</sub> and N<sub>2</sub>O applied emission factors are default factors taken from [IPCC 1997, 2006]. The emission factors for other pollutants (e.g. NO<sub>x</sub>, CO and NMVOC) were selected from existing sets by taking into account industrial technologies and combustion conditions.

Emissions in 1.A.1 *Energy Industries* category are estimated for each fuel according to data on the year consumption value given in *Energy Statistics* published by Central Statistical Office (GUS). Calculation of emissions are carried out for detailed sub-categories as follows:

a) 1.A.1.a *Public Electricity and Heat Production*

- *Public thermal plants* – electricity generation (PKD<sup>1</sup> 40.1),
- *Public thermal plants* – heat generation (PKD 40.1)
- *Autoproducing thermal plants* – electricity generation (PKD 40.1)
- *Autoproducing thermal plants* – heat generation (PKD 40.1)
- *Public heat plants* (PKD 40.3)
- *Non-public heat plants* (PKD 40.3)
- *Boilers in public thermal plants* (PKD 40.3)

b) 1.A.1.b *Petroleum Refining* (PKD 23.2)

- *Manufacture of refined petroleum products* (PKD 40.3)

c) 1.A.1.c *Manufacture of Solid Fuels and Other Energy Industries*

- *Manufacture of coke oven products* (PKD 23.1)
- *other energy industries* (PKD 10.1, 10.2, 11.1, 40.1 and 40.3 – only direct consumption of fuels included)

Emissions in 1.A.2 *Energy Industries* category are estimated for each fuel in detailed sub-categories as follows:

a) *Iron and Steel* - 1.A.2.a (PKD 27 excluding activities connected with 1.A.2.b *Non-Ferrous Metals* sub-category given below)

b) *Non-Ferrous Metals* - 1.A.2.b (PKD 27.4, 27.53, 27.54)

c) *Chemicals* - 1.A.2.c (PKD 24 i 25)

d) *Pulp, Paper and Print* - 1.A.2.d (PKD 21 i 22)

e) *Food Processing, Beverages and Tobacco* - 1.A.2.e (PKD 15 and 16)

f) *Other* - 1.A.2.f:

- *construction* (PKD – section F) and *other industry branches not included elsewhere*: (PKD 13-14, 17-20, 26, 28-37, 40.2, 41)
- *off-road and other mobile machinery in industry and construction sectors*

Estimation of emissions in 1.A.3 *Transport* are carried out for each fuel in sub-categories listed below:

a) *Civil Aviation* (1.A.3.a)

b) *Road Transportation* (1.A.3.b)

c) *Railways* (1.A.3.c)

d) *Navigation* (1.A.3.d)

e) *Other Transportation* (1.A.3.e)

---

<sup>1</sup> PKD – (Polska Klasyfikacja Działalności) – Polish Classification of Economic Activities

Emissions in 1.A.4 *Other Sectors* are estimated for each fuel in detailed sub-categories given below:

a) *Commercial/Institutional* (1.A.4.a) (PKD sections excluding sections connected with categories included elsewhere, it means excluding sections A-F and I)

b) *Residential* (1.A.4.b)

c) *Agriculture/Forestry/Fisheries* (1.A.4.c) (PKD – sections A and B)

- agriculture – stationary sources,
- agriculture – mobile sources
- fisheries.

Emissions in 1.A.5 *Other* are estimated for each fuel in detailed sub-categories as follows:

a) *stationary* (1.A.5.a) – (PKD – section I – only stationary sources from this)

b) *mobile* (1.A.4.b)

- other national aviation (not included in 1.A.3.a)
- emission from the use of motor gasoline, diesel oils and liquid gas calculated in the inventory as statistical difference between total direct consumption of these fuels given in statistic and summary results of consumption in categories 1.A.1, 1.A.2, 1.A.3 and 1.A.4.

List of fuels for which GHG emissions are estimated is as follow:

- liquid fuels: fuel oil, liquid petroleum gas (LPG), crude oil, refinery gas, non-energy products, feedstocks, other energy sources, gaseous waste fuels
- gas fuels: high – methane natural gas, coal-bed methane, nitrified natural gas
- solid fuels: hard coal, lignite, coke, coke oven gas, blast furnace gas, town gas, industrial wastes, municipal wastes - (non-biomass fraction)
- biomass: fuel wood, solid biomass and animal products, biogas, municipal wastes - (biomass fraction).

#### *Sources of information*

The correct inventory of GHG emissions for stationary sources, carried out by:

- precise determination of activities for categories: 1.A.1, 1.A.2, 1.A.4 and 1.A.5 and
- correct calculation or selection of emission factors for CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O

is supported by data found in the following periodic publications (annual or less frequent) or statistical yearbooks for some economy sectors:

- Electrical Power Statistics [GUS 2003a]
- Energy Balance Poland – OECD [ARE 2002]

Emission factors for stationary combustion in the sectors 1.A.1, 1.A.2, 1.A.4 and 1.A.5 are presented in the tables 3.1-3.4. Empty cells for CO<sub>2</sub> emission factors mean that EF is calculated based on the functions described above. Country specific EFs are estimated based on measurements or based on literature and expert opinion (not calculated based on functions connected with NCV) are marked by italic. The other factors are default values taken from [IPCC 2006].

As concerns sector 1.A.3 *Transport*, activity data for road transport were taken from [ITS 2002]. CO<sub>2</sub> emissions factors for road transport come also from [ITS 2002]. All other emission factors are default values from [IPCC 1997, 2006]. Applied emission factors are presented in the table 3.5.

Other activity data sources are as follows:

- ◆ OECD Energy Balance for Poland, [ARE 2002],
- ◆ Questionnaire/Report G-03, [GUS 2002e],
- ◆ Statistical Yearbook of The Republic of Poland [GUS 2003],
- ◆ Non-published data from Energy Market Agency

Abbreviation explanations to table 3.5:

catal - catalytic converter  
BS - motor gasoline  
ON - diesel oil  
LG – liquid gas  
OP - fuel oil  
PL - jet fuel  
BL - aviation gasoline.

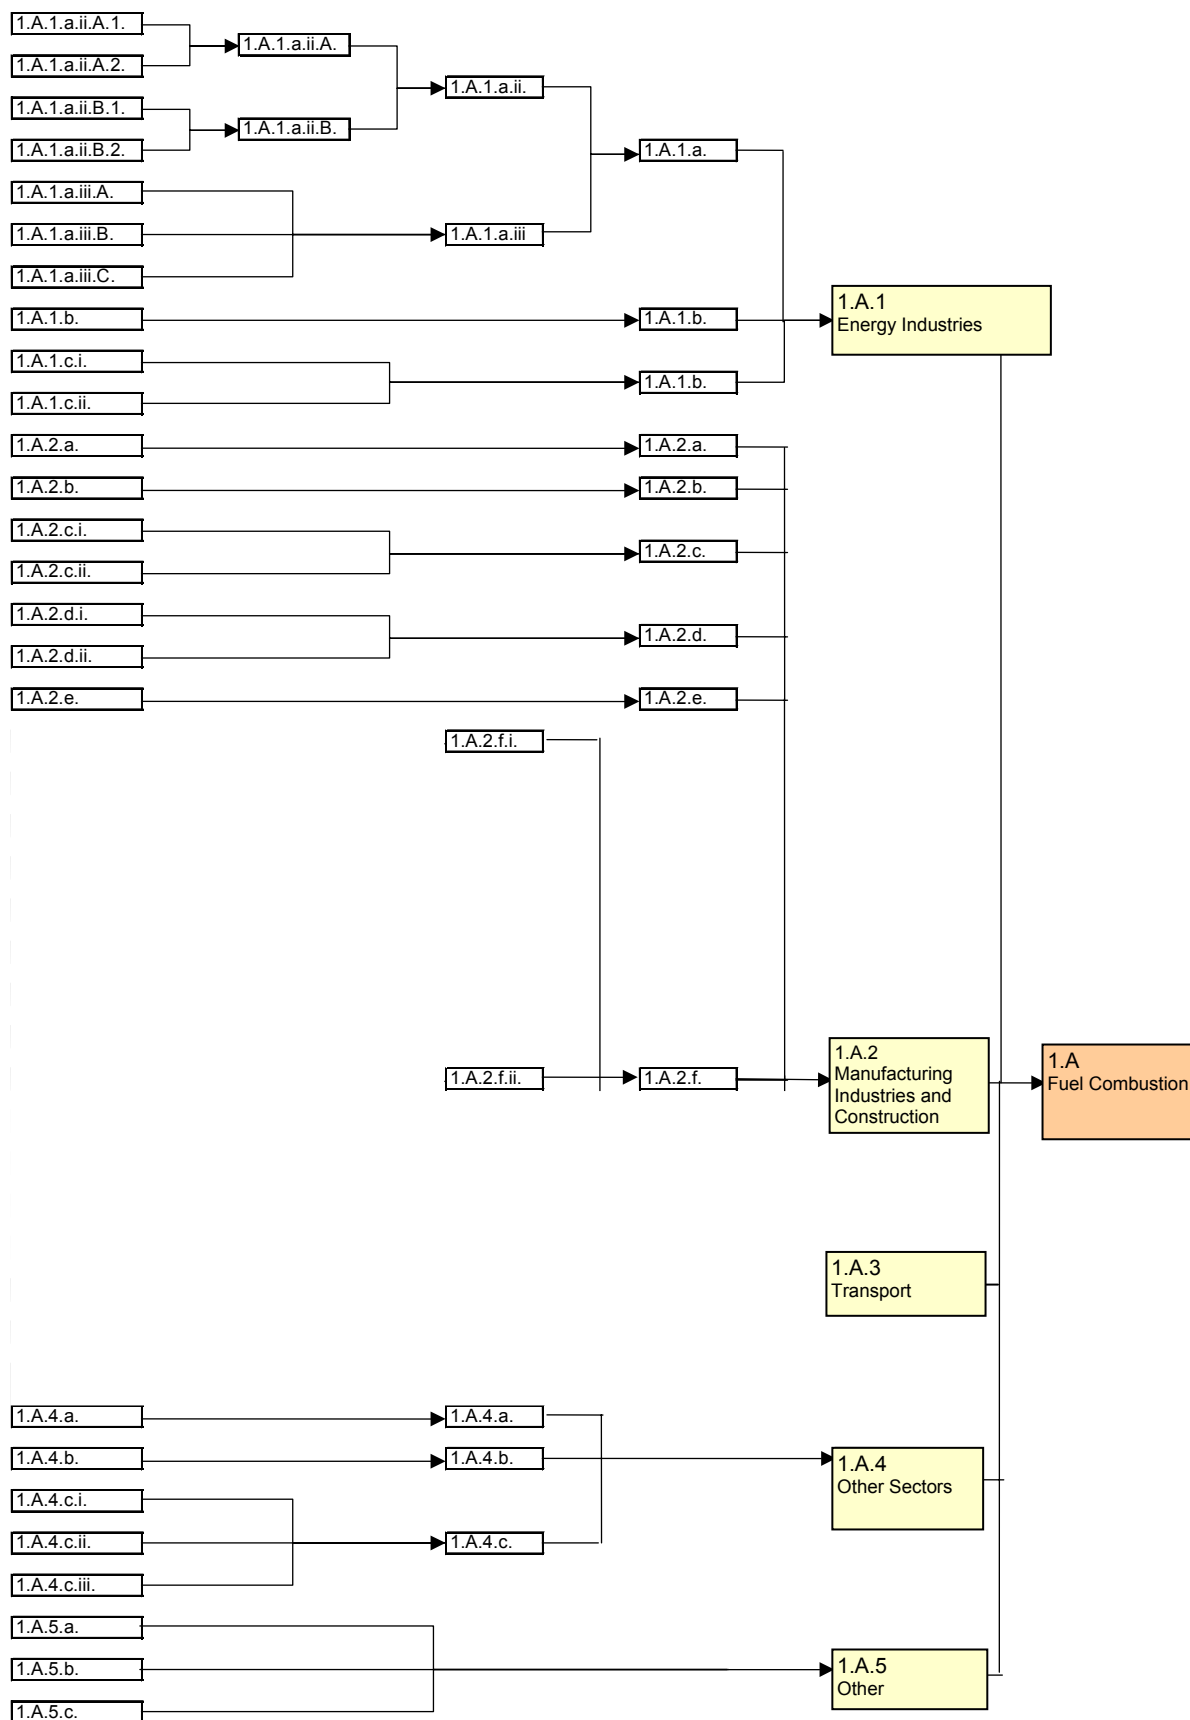

Figure 3.1. Flowchart of summing up sub-sectors in sector 1.A - Fuel Combustion

### 3.2.2 Fugitive emissions from fuels (CRF 1.B)

#### 3.2.2.1 Fugitive emissions from fuels – coal mining (CRF 1.B.1.a)

##### *Coal Mining and Handling – underground mines (CRF 1.B.1.a.i)*

Based on country study [Gawlik 1994, Gawlik, 2001] domestic emission factors were estimated for the following emission sources in mines: venting systems, methane capture systems, post-mining processes and production waste. The newest emission factors were estimated by [Kwarciński 2005] based on detail data and measurements for entire period 1988–2003. For the domestic inventory purposes emissions factors were calculated for 1 tone coal mined. The set of emissions factors are presented in table 3.6.

Table 3.6. Methane emission factors analysis

Emissions sources	[Gawlik 1994]		[Gawlik 2001]		[Kwarciński 2005]	
	Nm <sup>3</sup> CH <sub>4</sub> /Mg Coal	Nm <sup>3</sup> CH <sub>4</sub> /Mg Coal	Nm <sup>3</sup> CH <sub>4</sub> /Mg Coal	Nm <sup>3</sup> CH <sub>4</sub> /Mg Coal	Nm <sup>3</sup> CH <sub>4</sub> /Mg Coal	Nm <sup>3</sup> CH <sub>4</sub> /Mg Coal
Venting systems	6.0050	4.0234	6.4430	4.3168	5.8011	3.8868
De-methane systems			0.5962	0.3994	0.9927	0.6651
Post-mining processes	1.4810	0.9923	1.0200	0.6834	0.4288	0.2873
Production waste	0.0649	0.0435	0.0630	0.0422	0.0289	0.0194
Closed mines			0.0489	0.0328		0.0000

The following data and references for estimating emission factors for 2001 were used:

- venting processes – [Kwarciński. 2005]
- methane capture systems – direct data
- post-mining processes – [Kwarciński 2005]
- dumping grounds – [Kwarciński 2005]
- closed mines – [Gawlik 2001]

Table 3.7 contains the data on coal mining as well as methane captured and used for 2001. Emission from de-methane systems stands as a difference between methane capture and use.

Table 3.7. Data relating to coal mining and methane captured and used for 2001

Coal mining	Methane capture	Methane use	Emission from de-methane systems		
			mln m <sup>3</sup>	mln Nm <sup>3</sup>	Gg CH <sub>4</sub>
102.5	219.7	131.8	87.9	85.00	56.95

##### *Coal Mining and Handling – surface mines (CRF 1.B.1.a.ii)*

Fugitive emission of CH<sub>4</sub> from surface mining was estimated based on the activity data concerning lignite extraction amount from the study published by Polish Geological Institute [PIG, 2002] and country specific emission factor, which was taken from the study [Radwański 1995]. The value of these emission factors are as follow:

- Ventilation emission from coal seam – 0.007 m<sup>3</sup> CH<sub>4</sub> / t of extracted coal
- Ventilation emission from surrounding rocks - 0.012 m<sup>3</sup> CH<sub>4</sub> / t of extracted coal.

The conversion factor applied for recalculation of emitted methane volume upto mass of CH<sub>4</sub> is 0.67 kg/m<sup>3</sup>.

### 3.2.2.2 Fugitive emissions from fuels – coke oven gas (CRF 1.B.1.c)

*Tier 1* method has been used for calculation of fugitive emissions from coke oven gas system [GPG 2000], while emission factors presented in table 3.8 have been taken from domestic case study [Steczko 1994]. Activity data come from energy statistics [GUS 2003a].

Table. 3.8. Emission factors for CO<sub>2</sub> and CH<sub>4</sub> from coke oven gas system

CO <sub>2</sub> emission factors	[Gg/PJ]
gas processing	0.000194
gas transmission	0.020629
gas distribution	0.038056
CH <sub>4</sub> emission factors	
gas processing	0.000546
gas transmission	0.057977
gas distribution	0.106954

### 3.2.2.3 Fugitive emissions from fuels – oil (CRF 1.B.2.a)

*Tier 1* method has been used for calculation of fugitive emissions from oil system [GPG 2000]. Activity data come from energy statistics [GUS 2003a]:

production	PJ	32.652
distribution	Gg	18325

CO<sub>2</sub> and CH<sub>4</sub> factors used for estimation of emissions from oil production have been taken from country study [Żebrowski 1994] while for oil transmission default factors were used from [GPG 2000] (tab. 3.9).

Table 3.9. Emission factors for CO<sub>2</sub> and CH<sub>4</sub> from oil production and transmission

CO <sub>2</sub> emission factors		
production	EF CO <sub>2</sub> [Gg/PJ]	6.3150
transmission	EF CO <sub>2</sub> [Gg/m <sup>3</sup> ]	0.0054
CH <sub>4</sub> emission factors		
production	EF CH <sub>4</sub> [Gg/PJ]	0.0618
transmission	EF CH <sub>4</sub> [Gg/m <sup>3</sup> ]	0.00049

### 3.2.2.4 Fugitive emissions from fuels – natural gas (CRF 1.B.2.b)

Estimation of CO<sub>2</sub> and CH<sub>4</sub> emissions from systems of high-methane and nitrified natural gases was carried out based on *Tier 1* method [GPG 2000]. Activity data come from energy statistics [GUS 2003a] and are given in table 3.10.

Table 3.10. Activities for high-methane and nitrified natural gas systems.

Highmethane gas system		
Gas production	Gas production [PJ]	68.895
Gas processing	Gas use [PJ]	387.268
Gas transmission	Gas use [PJ]	387.268
Underground gas storage	Gas use [PJ]	387.268
Gas distribution	Gas use [PJ]	387.268
Nitrified natural gas system:		
Gas production	Gas production [PJ]	77.309
Gas processing	Gas use [PJ]	50.932
Gas transmission	Gas use [PJ]	50.932
Gas distribution	Gas use [PJ]	50.932

Emission factors for both gas systems were taken from country study [Steczko K. 1994] and are listed in tables 3.11 and 3.12.

Table 3.11. Emission factors for CO<sub>2</sub> and CH<sub>4</sub> from high-methane gas system.

CO <sub>2</sub> emission factors	[Gg/PJ]
Gas production	0.000402

Gas transmission	0.109475
Gas distribution	0.317671

## 4. Industrial Processes (CRF sector 2)

### 4.1 Key categories

Following categories from sector 2 have been identified as key sources:

- 2.A.1 Cement Production (CO<sub>2</sub> emission), share in total GHG emission 1.2%
- 2.B.2. Nitric Acid Production (N<sub>2</sub>O emission), share in total GHG emission 1.0%

Share of these categories in total Poland's GHG emissions is 2.3%.

### 4.2 Methodological issues

#### 4.2.1. *Mineral Products* (CRF 2.A)

##### 4.2.1.1. *Cement Production* (CRF 2.A.1)

CO<sub>2</sub> emission from cement production was estimated based on data on clinker production from [GUS 2003b]. The applied emission factor is equal 531 kg / Mg clinker. This country specific emission factor is taken from [IMMB 2006]

#### 4.2.1.2. *Lime Production* (CRF 2.A.2)

Emission of CO<sub>2</sub> from lime production was calculated based on data on lime production from [GUS 2003b]. The applied emission factor is equal 785 kg / Mg lime. This is default value given for quicklime (high calcium lime) production in [IPCC 1997].

#### 4.2.1.3. *Soda Ash Production and Use* (CRF 2.A.4 )

Soda Ash is produced in Poland in the Solvay Process. Emission of CO<sub>2</sub> from this process was assumed as 0. CO<sub>2</sub> emission from soda ash use was estimated based on assumption that amount of used soda ash is equal soda ash production. Data on soda ash production was taken from [GUS 2002e]. Value of emission factor taken for inventory calculation it is 415 kg CO<sub>2</sub>/Mg of soda ash used. This emission factor is recommended in [IPCC 1997].

### 4.2.2. *Chemical Industry* (CRF 2.B)

#### 4.2.2.1. *Ammonia Production* (CRF 2.B.1)

CO<sub>2</sub> and CH<sub>4</sub> emissions for ammonia production are estimated based on the data on gas and liquid ammonia production from [Radwański 2005]. The CO<sub>2</sub> emission factor (1.5 Mg CO<sub>2</sub>/Mg NH<sub>3</sub>) was taken from [IPCC 1997]. Methane emission factor is 4.9 kg CH<sub>4</sub> /Mg NH<sub>3</sub> produced was taken from [CITEPA 1992]. Emission N<sub>2</sub>O was estimated as 0, according to the study [Kozłowski 2001].

#### 4.2.2.2. *Nitric Acid Production* (CRF 2.B.2)

Estimation of N<sub>2</sub>O emission from nitric acid production was based on the annual HNO<sub>3</sub> production data from [GUS 2003b]. The applied country specific emission factor, which is equal 6.47 kg/Mg nitric acid [Kozłowski 2001].

#### 4.2.2.3. *Carbide Production* (CRF 2.B.4)

Activity data concerning calcium carbide production are published in [GUS 2003b]. CO<sub>2</sub> emission factor for this category, which is equal 1.100 Mg CO<sub>2</sub>/ Mg carbide, was taken from [IPCC 1997].

#### 4.2.2.4. *Other* (CRF 2.B.5)

##### - *Carbon Black Production*

CH<sub>4</sub> emission from production of black carbon was estimated based on annual black carbon production from [GUS 2002e]. The emission factor, which is equal 10 kg CH<sub>4</sub> /Mg black carbon, was taken from [CITEPA 1992].

##### - *Ethylene Production*

Emission of CO<sub>2</sub> from ethylene production was calculated based on ethylene annual production from [GUS 2003b]. Emission factor was taken from [CITEPA 1992]. Its value is 0.3 kg CO<sub>2</sub> / Mg ethylene produced.

##### - *Caprolactam Production*

Data on annual caprolactam production for inventory calculation purpose was taken from [GUS 2003b]. Applied country specific emission factor of N<sub>2</sub>O, which value is 4.74 kg N<sub>2</sub>O / Mg caprolactam produced, was assessed based on the Polish study [Kozłowski 2001].

#### 4.2.3. Metal Production (CRF 2.C)

##### 4.2.3.1. Iron and Steel Production (CRF 2.C.1)

###### 4.2.3.1.1. Iron Ore Sintering (CRF 2.C.1.a)

The value of annual iron ore sinter production was taken from [KASHUE 2006]. Country specific emission factor of CO<sub>2</sub>, which is equal 76.24 kg CO<sub>2</sub> / Mg iron ore sinter, was taken from [KASHUE 2006].

###### 4.2.3.1.2. Steel Cast Production (CRF 2.C.1.c)

The data on steel cast production for CO<sub>2</sub> emission calculation was taken from [GUS 2002e]. Country specific emission factor applied for CO<sub>2</sub> emission estimation is from [FEWE 1994]. Its value is 62 kg CO<sub>2</sub> / Mg steel cast produced.

###### 4.2.3.1.3. Iron Cast Production (2.C.1.d)

Annual iron cast production for CO<sub>2</sub> emission estimation was taken from [GUS 2002e]. Country specific emission factor applied for CO<sub>2</sub> emission calculation is from [FEWE 1994]. Its value is 61 kg CO<sub>2</sub> / Mg iron cast produced. Applied CH<sub>4</sub> emission factor is 0.20 kg CH<sub>4</sub> / Mg iron cast produced. It was taken from [Radwański 1995].

###### 4.2.3.1.4. Blast Furnaces Process (CRF 2.C.1.e)

Processing emission of CO<sub>2</sub> from blast furnaces was estimated based on elementary carbon budget in Blast Furnaces Process.

###### 4.2.3.1.5. Basic Oxygen Furnace Steel (CRF 2.C.1.f)

Basic oxygen furnace steel production was taken from [GUS 2003b]. Country specific CO<sub>2</sub> emission factor used for inventory report, which value is 11.26 kg CO<sub>2</sub> / Mg steel produced, was calculated in [FEWE 1994] based on composition of gases from basic oxygen furnaces in Polish plants.

###### 4.2.3.1.6. Electric Furnace Steel (2.C.1.g)

Annual electric furnace steel production was taken from [GUS 2003b]. Applied CO<sub>2</sub> country specific emission factor is equal 4.30 kg CO<sub>2</sub> / Mg steel produced and it was calculated in [FEWE 1994] based on composition of gases from electric furnaces in Polish plants. CH<sub>4</sub> emission factor, which value is 0.12 kg CO<sub>2</sub> / Mg steel produced, is country specific as well [FEWE 1994]. Results of measurements carried out in Polish steel plants were the sources of this emission factor [Olczak 1993].

###### 4.2.3.1.7. Coke production (CRF 2.C.1.j)

Processing emission of CO<sub>2</sub> from coking plants was estimated based on elementary carbon budget in coking plants process. CH<sub>4</sub> emission was estimated based on coke production volume from [GUS 2003b] and emission factor is 0.2 kg CH<sub>4</sub> / Mg coke produced [EEA 1996].

##### 4.2.3.2. Ferroalloys production (CRF 2.C.2)

Emission of CO<sub>2</sub> concerning ferroalloys production was estimated based on annual ferrosilicon production taken from [GUS 2003b]. Applied emission factor, which value is 3900 kg CO<sub>2</sub> / Mg ferrosilicon, was taken from [IPCC 1997] for ferrosilicon – 75% Si.

#### 4.2.3.3. Aluminium Production (CRF 2.C.3)

Calculation of CO<sub>2</sub> emission from primary aluminium production is based on the data on aluminium production published in [GUS 2003b]. The emission factor, which is equal 1.8 Mg CO<sub>2</sub> / Mg primary aluminium, was taken from [IPCC 1997] as value recommended for Soderberg Process.

#### 4.2.4. Consumption of Halocarbons and SF<sub>6</sub> (CRF 2.F)

Emissions of HFC, PFCs and SF<sub>6</sub> are based on activity data available at public statistics data and data collected by surveys among importers and exporters of CFCs and F-gases. In case of refrigeration and air-conditioning equipment containing HFCs, some information concerning e.g. amounts of gas used, are collected by experts among main domestic producers and importers/exporters. The emission factors for HFC-134a [IPCC 2000] are given in table 4.1.

Table 4.1. HFC-134a emission factors

Emission sources	Emission factor
Devices used In households (refrigerators and freezers) - use	0.5 %
Commercial devices (window refrigerators and chamber freezers) – devices production	3 %
Commercial devices (window refrigerators and chamber freezers) – devices use	20 %

Activity data applied to estimate the PFC and SF<sub>6</sub> emissions in 2001 are presented in table 4.2. The main source of emission of PFC gases in Poland is aluminium production (table 4.2, marked as bold). Activities on aluminium production were taken from [GUS 2003b]. *Tier 1* method and the following emission factors as in [IPCC 2000] were used for estimation of PFC emissions:

for CF<sub>4</sub> EF = 0.61 kg/Mg aluminium produced

for C<sub>2</sub>F<sub>6</sub> EF = 0.061 kg/Mg aluminium produced

As concerns SF<sub>6</sub> – the only sources estimated in Poland are electrical equipment and sound-proof windows. Activity data on import of this gas for 2001 is presented in table 4.2 (bold figure). Values on use of SF<sub>6</sub> (marked as underlined) were estimated based on mass analysis (table 4.2). The following emission factors [IPCC 2000] were used for calculation of SF<sub>6</sub> emission:

Equipment manufacturing – EF = 0.06 Mg/Mg

Equipment use – EF = 0.02 Mg/Mg.

Table 4.2 Activities used for estimation of emissions of PFC and SF<sub>6</sub>

Activity according to subsector	1995	1996	1997	1998	1999	2000	2001	2002	2003
2.C. Metal production

## 5. Solvent and Other Product Use (CRF sector 3)

### 5.1 Key categories

There are no sources from sector 3, which are identified as key sources.

### 5.2 Methodological issues

Calculations of CO<sub>2</sub> emissions within Sector 3, using the common methodology, were carried out on the basis of results of NMVOC emissions [IETU 2003]. from the following activities:

- Paint application (CRF 3.A)
- Degreasing and dry cleaning (CRF 3.B)
- Other solvents use (CRF 3.D)

CO<sub>2</sub> emission factor was determined assuming, that carbon content in NMVOC is 85%. Then carbon content has been calculated in a stoichiometric way to CO<sub>2</sub>. Calculations were made in accordance with formula:

$$\text{CO}_2 = 0.85 * 44/12 * \text{NMVOC}$$

where:

CO<sub>2</sub> – carbon dioxide emission from particular subsectors,

NMVOC – NMVOC emission from particular subsectors.

N<sub>2</sub>O emission from anaesthesiology was taken from the case study [IOŚ 2001].

## 6. Agriculture (CRF sector 4)

### 6.1 Key categories

Following categories from sector 4 have been identified as key sources:

- 4.A. Enteric Fermentation (CH <sub>4</sub> emission), share in total GHG emission	2.3%
- 4.B. Manure Management (CH <sub>4</sub> emission), share in total GHG emission	0.8%
- 4.B. Manure Management (N <sub>2</sub> O emission), share in total GHG emission	1.6%
- 4.D.1. Direct Soil Emissions (N <sub>2</sub> O emission), share in total GHG emission	3.1%
- 4.D.3. Indirect Soil Emissions (N <sub>2</sub> O emission), share in total GHG emission	1.0%

Share of these categories in total Poland's GHG emissions is 8.8%.

### 6.2 Methodological issues

#### 6.2.1. Methane from Enteric Fermentation (CRF 4.A)

The emission factors for estimation of CH<sub>4</sub> emission from enteric fermentation were calculated based on IPCC Guidelines [IPCC 2000] as well as the national case study [Myczko 2001] and updated data on animal breeding [Walczak 2003, 2006]. The CH<sub>4</sub> emission factors were estimated for each livestock subcategory within cattle: dairy cows and non-dairy cattle disaggregated for: calves under 1 year, young cattle 1-2 years and other matured cattle (over 2 years). Also domestic emission factor for sheep was estimated based on disaggregating this

livestock group for lambs under one year and mature sheep above one year. The emission factors for other livestock like goats, horses and swine come from [IPCC 1997].

CH<sub>4</sub> emissions for category 4.A Enteric fermentation for cattle and sheep were calculated using the IPCC *Tier 2* methodology. The emissions for goats, horses and swine were calculated using *Tier 1* methodology and default factors [IPCC 1997]. Activity data were obtained from national statistics [GUS 2003].

The calculated Gross Energy Intake (GE) values and applied emission factors expressed in kg CH<sub>4</sub> per head per year, including the weighted mean for all non-dairy cattle subcategories, are given in Table 6.1.

Table 6.1. Livestock population, daily Gross Energy Intake (GE) and CH<sub>4</sub> emissions factors in 2001

Livestock	Population [millions]	GE Gross Energy Intake [MJ/animal/day]	EF Emission Factor [kg CH <sub>4</sub> / animal / year]
4.A Enteric Fermentation	23.900	---	---
1 Cattle	5.734	---	---
a. Dairy cattle	3.005	234.326	92.214
b Non-dairy cattle	2.729	119.830	47.157
3 Sheep	0.343	18.873	8.383
4 Goats	0.172	---	5.000
6 Horses	0.546	---	18.000
8 Swine	17.105	---	1.500

#### 6.2.2. Methane from Manure Management (CRF 4.B)

The IPCC *Tier 2* methodology was used to establish domestic CH<sub>4</sub> emission factors for cattle, sheep and swine. The *Tier 1* methodology was used for estimation of default emission factors for goats, horses and poultry [IPCC 1997]. Animal population was taken from [GUS 2003].

Table 6.2. Livestock population, volatile solids excreted (Vs) and CH<sub>4</sub> emissions factors in 2001

Livestock	Population [millions]	Vs Volatile Solids Excreted [kg dm /animal/ day]	EF Emission Factor [kg CH <sub>4</sub> / animal / year]
4.B Manure Management	230.627	---	---
1 Cattle	5.734	---	---
a. Dairy cattle	3.005	4.459	6.276
b Non-dairy cattle	2.729	2.052	3.871
3 Sheep	0.343	0.377	0.175
4 Goats	0.172	0.280	0.120
6 Horses	0.546	1.720	1.390
8 Swine	17.105	0.500	6.536
9 Poultry	206.727	0.100	0.078

The factors recommended for cool climate were used. The country specific CH<sub>4</sub> emission factors for dairy and non-dairy cattle, sheep and swine were calculated based on:

- country specific data on the fraction of manure managed in given AWMS from [Walczak 2003, 2006] (see Table 6.3),
- B<sub>0</sub> (methane-producing potential) factors were taken from [IPCC 1997],

- VS (average daily volatile excreted solids) for dairy, non-dairy cattle and sheep were estimated based on country specific GE (average feed intake); VS for swine was the default value from [IPCC 1997]
- MCFs (methane conversion factors) for individual manure management systems concerning cool climate are from [IPCC 2000].

### 6.2.3. Nitrous oxide from Manure Management (CRF 4.B)

Livestock population for N<sub>2</sub>O emission calculation from manure management was taken from [GUS 2003]. The fractions of manure managed in given AWMS for each type of animals, taken from [Myczko 2001] and [Walczak 2003, 2006], are presented in the table 6.3.

Table 6.3. Fractions of manure managed in given AWMS for each type of animals in 2001

Livestock	Type of AWSM		
	Liquid System	Solid Storage and Drylot	Pasture Range and Paddock
Dairy cattle	0.0368	0.8312	0.1320
Non-dairy cattle	0.0931	0.7989	0.1080
Sheep	---	0.5000	0.50
Goats	---	0.9000	0.10
Horses	---	0.9000	0.10
Swine	0.2863	0.7137	---
Poultry	0.2000	0.8000	---

The default values of nitrogen excretion per head of animal for each type of animals (values for Eastern Europe) from [IPCC 1997] were used for emission calculation. Default values of N<sub>2</sub>O emission factors for management systems from [IPCC 1997] were applied (Tables 6.4.a, 6.4.b. and 6.5).

Table 6.4.a. Emissions of nitrogen excreted in livestock manure in:

#### a) liquid system

Livestock	Nitrogen excreted in manure Nex [kg/animal/year]	AWMS [ % / 100 ]	Nitrogen excreted in AWMS [ kg N / year / 1000 ]
1.a. Dairy cattle	70.0	0.0368	7740.880
1.b. Non-dairy cattle	50.0	0.0931	12703.495
3 Sheep	16.0	--	0.000
4 Goats	25.0	--	0.000
6 Horses	25.0	--	0.000
8 Swine	20.0	0.2863	97943.230
9 Poultry	0.6	0.2000	24807.297

#### b) solid storage and drylot

Livestock	Nitrogen excreted in manure Nex [kg/animal/year]	AWMS [ % / 100 ]	Nitrogen excreted in AWMS [ kg N / year / 1000 ]
1.a. Dairy cattle	70.0	0.8312	174842.920
1.b. Non-dairy cattle	50.0	0.7989	109009.905
3 Sheep	16.0	0.5000	2744.000
4 Goats	25.0	0.9000	3869.415
6 Horses	25.0	0.9000	12285.000
8 Swine	20.0	0.7137	244156.770
9 Poultry	0.6	0.8000	99229.189

Table 6.5. Factors of N<sub>2</sub>O–N emission for various manure management systems

Animal Waste Management Systems	EF Emission Factor [kg N <sub>2</sub> O-N/ kg N]

#### 6.2.4. Agricultural Soils (CRF 4.D)

##### 6.2.4.1. *Direct Soil Emission* (CRF 4.D.1)

##### 6.2.4.1.1. *N<sub>2</sub>O from synthetic fertilisers* (CRF 4.D.1.1)

N<sub>2</sub>O emission from synthetic fertilisers was estimated based on the amount of synthetic fertiliser nitrogen applied to agricultural fields published in [GUS 2003]. The nitrogen fraction converted to N<sub>2</sub>O was estimated as 0.9 (1–0.1 Frac<sub>gasf</sub> – see 4.D.3) and this is default value from [IPCC 1997]. The country specific emission factor (0.008 kg N<sub>2</sub>O-N / kg N applied) taken from [Mercik 2001] was corrected for 0.009 kg N<sub>2</sub>O-N / kg N as the previous one included the fraction of nitrogen that is emitted as NO<sub>x</sub> + NH<sub>3</sub>.

##### 6.2.4.1.2. *N<sub>2</sub>O from animal manure applied to soils* (CRF 4.D.1.2.)

Manure nitrogen use as fertiliser was estimated according to IPCC guidelines. The total amount of nitrogen in animal excreta was calculated based on animal population taken from [GUS 2003] and the default values of nitrogen excretion per head of animal for each type of animals (values for Eastern Europe) from [IPCC 1997]. The data on fraction of manure managed in each AWMS applied in Poland are the country specific data taken from Polish studies [Myczko 2001] and [Walczak 2003, 2006]. The fractions of manure managed in given AWMS for each type of animals are given in table 6.3.

N<sub>2</sub>O emission factors for all listed AWMS were taken from [IPCC 1997]. The fraction of nitrogen excreted during grazing was calculated based on data estimated for 4.D.2 *Pasture, range and paddock manure*. The value of the total nitrogen excretion fraction that is emitted as NO<sub>x</sub> and NH<sub>3</sub> (0.2 kg NH<sub>3</sub>-N + NO<sub>x</sub>-N / kg of nitrogen excreted by livestock) was taken from [IPCC 1997]. The fraction of livestock nitrogen excretion contained in excrements burned was assumed as 0 in calculations.

##### 6.2.4.1.3. *N<sub>2</sub>O from N-fixing crops* (CRF 4.D.1.3)

N<sub>2</sub>O emission from N-fixing crops was calculated based on the data on sown area of N-fixing crops, published in [GUS 2003]. According to study [Mercik 2001] 1% of nitrogen fixed by papilionaceous plants is denitrificated to N<sub>2</sub>O and in this connection the used emission factor value is 0.010 N<sub>2</sub>O-N/ kg N contained in papilionaceous plants. Most above ground plant parts is removed from fields in Poland, so only plant residues were taken into account in N<sub>2</sub>O emission calculation. Based on the data from the study mentioned above was assumed, that nitrogen amount in plant residues is 90 kg N/ha.

#### 6.2.4.1.4. *N<sub>2</sub>O from crop residue* (CRF 4.D.1.4)

Emission of N<sub>2</sub>O for non-N-fixing crop residues was calculated based on the information from [Mercik 2001]. that quantity of dry residue from 1 ha of non-N-fixing crop harvested area is 2 Mg d.m. / ha and content of nitrogen in plant residues is 0.76%. The emission factor for inventory purpose was taken from this study as well. Its value is 0.010 kg N<sub>2</sub>O-N/ kg N contained in residues. Data on sown area of other than N-fixing crops are published in [GUS 2003].

#### 6.2.4.1.5. *N<sub>2</sub>O from cultivation of histosols* (CRF 4.D.1.5)

The area of histosols in Poland is estimated as 1269 thousand ha [Mercik 2001] and this value was applied to entire inventory period from 1988. N<sub>2</sub>O emission from cultivation of histosols was estimated based on default emission factor for Mid-Latitude Organic Soils from [IPCC 2000]: 8 kg N<sub>2</sub>O-N /ha.

#### 6.2.4.2. *N<sub>2</sub>O from pasture, range and paddock manure* (CRF 4.D.2)

Animal population for calculation of N<sub>2</sub>O emission from pasture range and paddock was taken from [GUS 2003]. Total amount of nitrogen in animal excreta was estimated based on the data presented in the table 6.6. The default values of nitrogen excretion per head of animal for each type of animals (values for Eastern Europe) from [IPCC 1997] were used. The data on fraction of manure related with grazing animal are the country specific data taken from Polish studies [Myczko 2001, Walczak 2006]. N<sub>2</sub>O emission factor (0.02) for pasture range and paddock was taken from [IPCC 1997].

Table 6.6. Fraction of manure related with grazing animal, nitrogen excreted in AWMS systems and factor of N<sub>2</sub>O–N emission

Livestock	Nitrogen excretion Nex [kg/head/yr]	Fraction of manure nitrogen per AWMS [ % / 100 ]	Nitrogen excreted in AWMS [ kg N / year / 1000 ]	EF Emission factor for AWMS [kg N <sub>2</sub> O-N/ kg N ]
1.a. Dairy cattle	70.0	0.13	27766.200

		total	47041.735	0.020

### 6.2.4.3. Indirect emissions (CRF 4.D.3)

The *Tier 1a* method was used for assessing indirect emissions of N<sub>2</sub>O for 2001 in Poland. The basic equation for estimating a country's indirect N<sub>2</sub>O emissions:

$$N_2O_{\text{indirect} \rightarrow N} = N_2O_{(G) \rightarrow N} + N_2O_{(L) \rightarrow N}$$

where:

$N_2O_{\text{indirect} \rightarrow N}$  – emissions of N<sub>2</sub>O in units of nitrogen.

$N_2O_{(G) \rightarrow N}$  – N<sub>2</sub>O produced from volatilisation of applied synthetic fertiliser and animal manure N. and its subsequent atmospheric deposition as nitrogen compounds (kg N/year).

$N_2O_{(L) \rightarrow N}$  – N<sub>2</sub>O produced from leaching and runoff of applied fertiliser and animal manure N (kg N/year).

#### 6.2.4.3.1. Atmospheric deposition (CRF 4.D.3.1)

Atmospheric deposition of nitrogen compounds fertilises soils and surface waters. It results in enhanced biogenic N<sub>2</sub>O formation. According to this methodology the amount of N applied to soils is equal to the total amount of synthetic fertiliser nitrogen applied to soils plus the total amount of animal manure nitrogen excreted in country. Those values have to be multiplied by appropriate volatilisation factors. This sum is then multiplied by an emission factor (table 6.7). Calculations were made according to the following equation:

$$N_2O_{(G) \rightarrow N} = [(N_{\text{FERT}} * \text{Frac}_{\text{GASF}}) + (N_{\text{ex}}/1000 * \text{Frac}_{\text{GASM}})] * \text{EF}$$

where:

$N_2O_{(G) \rightarrow N}$  – N<sub>2</sub>O produced from volatilisation of applied synthetic fertiliser and animal manure N. and its subsequent atmospheric deposition as nitrogen compounds.

$N_{\text{FERT}}$  – total amount of synthetic nitrogen fertiliser applied to soils. this value is taken from [GUS 2003].

$N_{\text{ex}}$  – total amount of animal manure nitrogen excreted in AWMS system (table 6.6).

$\text{Frac}_{\text{GASF}}$  – fraction of synthetic N fertiliser that volatilises to nitrogen compounds. default value.

$\text{Frac}_{\text{GASM}}$  – fraction of animal manure N that volatilises to nitrogen compounds. default value.

EF – emission factor for N<sub>2</sub>O emissions from atmospheric deposition of N on soils and water surfaces. default value.

Table 6.7. Estimation of indirect emissions of N<sub>2</sub>O–N from atmospheric deposition

$N_{\text{fert}}$ [Gg/year]	$\text{Frac}_{\text{GASF}}$ [kg N/kg N]	$N_{\text{ex}}$ [kgN/year/1000]	$\text{Frac}_{\text{GASM}}$ [kg N/kg N]	EF [kgN <sub>2</sub> O-N/kg N]	$N_2O_{(G) \rightarrow N}$ [GgN <sub>2</sub> O-N]
895	0.1	47 041.74	0.2	0.01	0.99

#### 6.2.4.3.2. Nitrogen leaching and run-off (CRF 4.D.3.2)

Part of the nitrogen is lost from agricultural soils through leaching and runoff. and gets to the groundwater, rivers and wetlands. It results in biogenic production of N<sub>2</sub>O. To estimate the amount of applied N that leaches or runs off, the total amount of synthetic fertiliser nitrogen and the total amount of animal N excretion must be summed and then multiplied by a fraction of N input, that is lost through leaching and runoff. Then it must be multiplied by an appropriate emission factor (table 6.8). Calculations were made according to the following equation:

$$N_{2O(L) \rightarrow N} = (N_{FERT} + N_{ex}/1000) * \text{Frac}_{LEACH} * EF.$$

where:

N<sub>2O(L)→N</sub> – N<sub>2</sub>O produced from leaching and runoff of applied fertiliser and animal manure N.

N<sub>FERT</sub> – total amount of synthetic nitrogen fertiliser applied to soils, this value is taken from [GUS 2003].

N<sub>ex</sub> – total amount of animal manure nitrogen excreted in AWMS system (table 6.6).

Frac<sub>LEACH</sub> – fraction nitrogen input to soil that is lost through leaching and runoff, default value.

EF – emission factor for N<sub>2</sub>O emissions for leaching/runoff, default value.

The values, that were taken to calculations and emissions, are presented in table 6.8.

Table 6.8. Estimation of indirect emissions of N<sub>2</sub>O–N from nitrogen leaching and run-off

N <sub>fert</sub> [Gg/year]	N <sub>ex</sub> [kgN/year /1000]	Frac <sub>LEACH</sub> [kg N/kg N]	EF [kgN <sub>2</sub> O-N/kg N]	N <sub>2O(L)→N</sub> [GgN <sub>2</sub> O-N]
895	47 041.74	0.3	0.025	7.065

The following equation is a conversion of N<sub>2</sub>O→N emissions to N<sub>2</sub>O emissions:

$$N_{2O} = N_{2O \rightarrow N} * 44/28$$

#### 6.2.5. Field Burning of Agricultural Residues (CRF 4.F)

CH<sub>4</sub> and N<sub>2</sub>O emissions from burning of agricultural residues in fields were estimated based on methodology described in [IPCC 1997]. For domestic purposes there were selected 38 crops containing cereals, pulses, tuber and root, oil-bearing plants, vegetables and fruits [Łoboda *at al* 1994] which residues could be burned on fields. Activity data concerning crop production was taken from [GUS 2003]. Factors applied for emissions calculation were taken from country study [Łoboda 1994] where experimental and literature data as well as default emission factors were used. These values are presented in the table 6.9.

Table 6.9. Factors applied for CH<sub>4</sub> and N<sub>2</sub>O emission estimation from field burning of agriculture residues

Crops	Residue to crop ratio	Dry matter fraction	Fraction burned in fields	Fraction oxidised	Carbon fraction of residue	N / C	Aggregated emission factors	
							CH <sub>4</sub>	N <sub>2</sub> O

## 7. Land Use Change and Forestry (CRF sector 5)

### 7.1 Key categories

Sector 5 is not analyzed in key source analyses.

### 7.2 Methodological issues

All calculations within the GHG inventory for LUCF in Poland in 2001 were prepared using the [IPCC 1997] methodology. The land use transition matrix was not available during the inventory preparation hence the methodology suggested by GPG LULUCF could not be applied. The obtained GHG estimates were first inserted into the old CRF file, and then translated into the CRF required by GPG LULUCF. Majority of cells in the new CRF could

not be filled in and those filled in were calculated by means of the transition matrix presented in table 7.2.

Reporting under the GPG LULUCF requires significant improvements in data collection and access to data on changes in land uses. The current calculations are based on net land use changes (with exception to afforestation/reforestation and deforestation for which gross data are available). This most likely underestimates the actual emissions and removals in this category. The underestimation may bias GHG estimates but direction and degree of the bias can not be easily inferred.

The inventory results for 2001 (and comparing to 2000) for LULUCF sector are presented in the following tables according to new [IPCC 2003] and previous [IPCC 1997] methodologies.

Table 7.1. Total CO<sub>2</sub> emissions and removals from Land Use Change and Forestry in 2000 and 2001 [IPCC 2003]

According to calculation for 2001, Sector 5. Land-Use Change and Forestry, was net CO<sub>2</sub> sink. Removals/emissions balance increased from 28 048 Gg CO<sub>2</sub> in 2000 to 31 070 Gg CO<sub>2</sub> in 2001 and included results from groups given below.

#### 7.2.1. Changes in Forest and Other Woody Biomass Stocks (old CRF 5.A)

GHG balance in this group is a net sink. In 2001 net CO<sub>2</sub> removals increased to 21 640 Gg CO<sub>2</sub> from about 18 452 Gg CO<sub>2</sub> in 2000. This change was caused by harvest of thick decrease (about 1.0 million m<sup>3</sup> of wood).

##### Increase in forest

Increase of woody biomass in forest of all owners forms was estimated based on data published in Statistical Year Book for Forestry. Source data contains also area–volume tables with age classes prepared by Forest Management and Geodesy Bureau in order of Directorate General of State Forests published in annual reports “Results of updated estimates of forestry areas and resources in state owned forests”.

Data published in statistical yearbooks are of synthetic character – (apply to all types together or separately for conifers and broadleaves only).

Estimation of actual increase (m<sup>3</sup>/ha/year) for all forests is based on data of increment in growing stock and harvest of thick. Data of harvest of thick are given as net volume of thick wood (without bark). For calculation of harvest of thick it is necessary to add estimated volume of thick bark to net harvest of thick (assume that thick bark is about 25% of thick wood without bark [Czuraj, 1991]. Increase is determined by forest type, age class and quality of forest habitats.

Harvest of thick and growing stock were converted into mass of biomass separately, using expansion ratio for timber removals and conversion for growing stocks.

Calculations were based on average values, regarded as approximation of real values. Methodology for biomass annual increase calculations should be still improved, among others for better show long and short term trends. For calculations there were used default factor describing fraction of elementary carbon in dry matter 0.5 [IPCC 1997].

#### 7.2.2. Forest and Grassland Conversion (old CRF 5.B)

In 2001 this category was a net CO<sub>2</sub> emissions and accounted for about 40 Gg CO<sub>2</sub>. Net emission in year 2001 was lower than in 2000 and it was caused by lessening forest area transmitted into non-forest tasks.

Emissions ratios for calculation CH<sub>4</sub>, N<sub>2</sub>O, CO and NO<sub>x</sub> emissions from biomass burning are presented in table below.

Table 7.4. Emissions ratios for calculation CH<sub>4</sub>, N<sub>2</sub>O, CO and NO<sub>x</sub> emissions from biomass burning.

Compound	Ratio		
CH <sub>4</sub>	0.012	default	[IPCC 1997]
CO	0.060	default	[IPCC 1997]
N <sub>2</sub> O	0.007	default	[IPCC 1997]
NO <sub>x</sub>	0.121	default	[IPCC 1997]

Ratio of carbon to nitrogen in burning biomass was taken as 0.001 and default factor of carbon fraction in aboveground biomass is equal 0.5 [IPCC 1997]. Both default factors for fraction of carbon oxidized on and off site are equal to 0.9 [IPCC 1997].

In this category emission of other than CO<sub>2</sub> GHGs is reported from forest fires only. Assumption is made that woody biomass is not burnt entirely during fires (only canopies and underwood are damaged) so if there is a need for moving out damaged or dead woods it is included into total wood harvest. Controlled burning of forests is not practiced in Poland.

#### 7.2.3. Abandonment of Managed Lands (old CRF 5.C)

According to [IPCC 1997] definition, there is no anthropogenic activity on abandonment lands in Poland, so such category is not considered here. Generally agriculture lands are converted to forests or come under municipal management.

#### 7.2.4. CO<sub>2</sub> Emissions and Removals from Soil (old CRF 5.D)

GHG balance in this category is a net sink. In 2001 net CO<sub>2</sub> sink was about 9 470Gg CO<sub>2</sub> and was lower by about 179 Gg CO<sub>2</sub> than in previous year.

This result is influenced by emission from agriculture lands, which is mainly caused by changes of agriculture lands into other lands, as well as removal increase in other land category – caused by these changes.

In order to calculate carbon emissions and removals in soils, area of country was divided into forestland, cropland and other lands. Other lands are used for balance country area.

Soil types occurring in Poland are as follow.

#### **Forests soils**

Estimation of different soil types area (high activity soils, low activity soils, sandy and wetland) is based on area of forest habitat types (Table 7.5). Next the percentage fractions of all soil types in forest management were calculated (Table 7.7).

Table 7.5. Forest soils type occur in Poland.

Soil type	Forest habitat types
High Activity Soils	Fresh mixed forest, moist mixed forest, mixed upland forest, mountain mixed forest, fresh broadleaved forest, moist broadleaved forest upland forest, mountain forest
Low Activity Soils	Moist coniferous forest, mountain coniferous forest, high- mountain coniferous forest, 0,5*fresh mixed coniferous forest, moist mixed coniferous forest, upland mixed coniferous forest, mountain mixed coniferous forest
Sandy	Dry coniferous forest, fresh coniferous forest, 0,5* fresh mixed coniferous forest
Wetland	Marshy coniferous forest, boggy mountain coniferous forest, boggy mixed coniferous forest, boggy mixed forest, alder forest, ash- alder swamp forest, mountain alder forest, floodplain forest, mountain floodplain forest

### ***Agriculture soils***

Estimation of area of different soil types (high activity soils, low activity soils, sandy and wetland) is based on area of soil valuation classes (Table 7.6). Then percentage fraction of all soil types in croplands, grasslands and other lands were calculated (Table 7.7).

**Table 7.6. Agricultural land by soil valuation classes**

Soil type	Soil Valuation classes
High Activity Soils	I, II, III
Low Activity Soils	IV
Sandy	V
Wetland	other

**Table 7.7. Percentage fraction of soil type by land use system (for time t and t–20)**

Climate	Land use	Soil type (t)			
	Land-use/ management system	High Activity Soils	Low Activity Soils	Sandy	Wetland
		(%)			
Temperate	Forest management	39.6	19.0	37.2	4.2
	Grassland/Rangeland	14.6	43.1	31.5	10.7
	Agricultural crops	29.1	39.0	20.1	11.7
	Rest land	21.9	41.1	25.8	11.2
Climate	Land use	Soil type (t-20)			
	Land-use/ management system	High Activity Soils	Low Activity Soils	Sandy	Wetland
		(%)			
Temperate	Forest management	31.4	19.8	45.1	3.7
	Grassland/Rangeland	14.7	41.0	32.1	12.2
	Agricultural crops	27.8	39.3	20.6	12.3
	Rest land	21.3	40.1	26.3	12.3

**Table 7.8. Area of soil type by land use system in 2001**

Land-use/ management system	Soil type	Carbon in soils (Mg C/ha)	Area (Mha)
Forest management	High Activity Soils	110.0	3.599
	Low Activity Soils	70.0	1.727
	Sandy	30.0	3.381
	Wetland	230.0	0.382
Sum			9.088
Grassland/Rangeland	High Activity Soils	90.0	0.553
	Low Activity Soils	60.0	1.632
	Sandy	25.0	1.193
	Wetland	120.0	0.405
Sum			3.783
Agricultural crops	High Activity Soils	70.0	3.868
	Low Activity Soils	60.0	5.183
	Sandy	25.0	2.672
	Wetland	120.0	1.556
Sum			13.279
Other land	High Activity Soils	56.0	1.119
	Low Activity Soils	48.0	2.103
	Sandy	20.0	1.323
	Wetland	96.0	0.574
Sum			5.119
Total			31.2685

Carbon stock rates in soils were taken as default factors from [IPCC 1997] and corrected to domestic conditions by experts.

Estimation of CO<sub>2</sub> emissions and removals by soils is approximate and will be corrected by new methodology presented in [IPCC 2003]. Emissions and removals from soils were calculated separately, then the net emission/removal balance was estimated.

#### 7.2.5. Carbon emissions from agricultural lime application (old CRF 5.D)

The reported annual carbon emission from agricultural lime application is calculated as:

$$C = M_{\text{limestone}} * EF_{\text{limestone}} + M_{\text{dolomite}} * EF_{\text{dolomite}}$$

where:

M<sub>limestone</sub> - annual amount of sold calcic limestone [Mg/yr],

M<sub>dolomite</sub> - annual amount of sold calcic dolomite [Mg/yr],

EF<sub>limestone</sub> - emission factor for limestone – 0.120 [Mg C/ Mg limestone],

EF<sub>dolomite</sub> - emission factor for dolomite – 0.122 [Mg C/ Mg dolomite].

Domestic statistic publications contain only data of use of lime fertilizers in pure nutrient (CaO), that it was necessary to convert these data into actual use of fertilizers [Radwański 2006b]. It was assumed that lime – magnesium fertilizers (CaMg(CO<sub>3</sub>)<sub>2</sub>) contains 89.1% of CaCO<sub>3</sub> and 10.9% of MgCO<sub>3</sub>. Carbon (C) is converted to carbon-dioxide (CO<sub>2</sub>) by the conversion factor 44/12.

## 8. Waste (CRF sector 6)

### 8.1 Key categories

Following categories from sector 6 have been identified as key sources:

- |   |      |
|---|------|
| - 6.A. Solid Waste Disposal on Land (CH <sub>4</sub> emission), share in total GHG emission | 1.6% |
| - 6.B. Wastewater Handling (CH <sub>4</sub> emission), share in total GHG emission          | 0.9% |

Share of these categories in total Poland's GHG emissions is 2.6%.

### 8.2 Methodological issues

#### 8.2.1 Solid Waste Disposal on Land (CRF 6.A)

The methane emissions from solid waste disposals in 2001 were calculated using the IPCC Waste Model published in [IPCC 2006]. The model establish multiyear series when methane is generated from organic matter decomposition in anaerobic conditions. The emission of CH<sub>4</sub> is diminished by recapturing of this gas.

The following indicators were used for estimation of CH<sub>4</sub> emissions:

- DOC – degradable organic carbon in the year of deposition (table 8.1, default value [IPCC 2006])

- $DOC_f$  – fraction of DOC that can decompose (fraction) (table 8.1, default value [IPCC 2006])
- MCF –  $CH_4$  correction factor for aerobic decomposition in the year of deposition (table 8.2, default value [IPCC 2006])
- OX – Oxidation Factor reflecting the amount of  $CH_4$  from solid waste disposal sites that is oxidised in the soil or other material covering the waste (table 8.3, default value [IPCC 2006])
- $k$  – reaction constant [Steczko 2001] (table 8.3)
- $F$  – fraction of  $CH_4$  by volume, in generated landfill gas (fraction) [Steczko 2001] (table 8.3).
- $R$  – methane recovery assumed as 0.

Table 8.1. DOC and  $DOC_f$  indicators

DOC (Degradable Organic Carbon)	Range	Default	Adopted Value
Food waste	0.08-0.20	0.15	0.15
Garden	0.16-0.19	0.2	0.2
Paper	0.36-0.45	0.4	0.4
Wood and straw	0.39-0.46	0.43	0.43
Textiles	0.20-0.40	0.24	0.24
Disposable nappies	0.18-0.32	0.24	0.24
Sewage sludge	0.04-0.05	0.05	0.05
Industrial waste	0-0.54	0.15	0.15
$DOC_f$		0.5	0.5

Table 8.2. MCF indicators of organic carbon in disposed waste

Unmanaged, shallow	Unmanaged, deep	Managed	Managed, semiaerobic	Uncategorised
0.4	0.8	1	0.5	0.6

Table 8.3. Indicators  $k$ ,  $F$  and OX assumed for calculations

Methane generation rate constant ( $k$ )	Range	Default	Value
Food waste	0.1–0.2	0.185	0.086
Garden	0.06–0.1	0.1	0.069
Paper	0.05–0.07	0.06	0.039
Wood and straw	0.02–0.04	0.03	0.023
Textiles	0.05–0.07	0.06	0.039
Disposable nappies	0.06–0.1	0.1	0.1
Sewage sludge	0.1–0.2	0.185	0.185
Industrial waste	0.08–0.1	0.09	0.09
Delay time (months)		6	6
Fraction of methane ( $F$ ) in developed gas		0.5	0.618
Oxidation factor (OX)		0	0

Activities used for estimation of  $CH_4$  emissions from solid waste disposals contain:

- Population – number of population was taken from [GUS 2003]
- Municipal Solid Wastes (MSW) – for years 1971-1973 data were interpolated on a basis of data from 1970 and 1974. The same method was used for 1976. In domestic statistics data were given in  $dm^3$ . To recalculate data into Gg a conversion factor was used. According to GUS this conversion factor is  $0.25 \text{ t/m}^3$ .

Table 8.4. Data sources for amount of municipal waste

1970	4113.98	[GUS 1987]
1971	4624.65	interpolacja
1972	5135.31	interpolacja
1973	5645.98	interpolacja

1975	6788.96	[GUS 1986d]
1976	7397.99	interpolacja
1977	8007.03	[GUS 1981d]
1978	8702.83	[GUS 1981d]
1979	9052.63	[GUS 1981d]
1980	9868.72	[GUS 1986d]
1981	10014.42	[GUS 1986d]
1982	10329.07	[GUS 1986d]
1983	10541.91	[GUS 1986d]
1984	10864.54	[GUS 1986d]
1985	11086.95	[GUS 1986d]
1986	11546.86	[GUS 1987]
1987	11877.45	[GUS 1989d]
1988	12084.18	[GUS 1989d]
1989	12000.95	[GUS 1990d]
1990	11098.28	[GUS 1996]
1991	10637.98	[GUS 1996]
1992	10621.00	[GUS 1996]
1993	10644.66	[GUS 1996]
1994	11014.64	[GUS 1996]
1995	10985.00	[GUS 2005d]
1996	11621.22	[GUS 1997d]
1997	12183.44	[GUS 1998d]
1998	12275.77	[GUS 1999d]
1999	12316.90	[GUS 2000d]
2000	12226.00	[GUS 2005d]
2001	11109.00	[GUS 2005d]

The percentage of waste generated, which goes to solid waste disposal sites – according to the GUS Statistical Yearbook, Environment 1990, in 1982-1990 there was no combustion of waste and the composting was on level of 0.1% (the same in 1981 – GUS 1987). Because of the lack of data, for other years this value was assumed on level of 0.1%. Distribution of solid waste disposal sites for managed and unmanaged ones was made in accordance to elaboration [Gworek 2003].

Composition of waste (according to IPCC) was assumed on a basis of National Plan on Waste Management (table 8.5)

Table 8.5. Composition of waste

Food	Garden	Paper	Wood	Textile	Plastics, other inert
18%	2%	16%	3%	3%	57%

## 8.2.2 Waste Water Handling (CRF 6.B)

### 8.2.2.1. Industrial wastewater (CRF 6.B.1)

Methane emission from industrial wastewater was estimated based on activity data from particular industrial sectors [GUS 2002d] and fraction of treated wastewater using default factors of Biochemical Oxygen Demand (BOD). Also the default values of maximum methane producing capacity were used [IPCC 2006]. Share of anaerobic treatment of wastewater was taken from [Radwański 1995] (table 8.6).

Table 8.6. Data for CH<sub>4</sub> emission estimation from Industrial Wastewater Handling

Industry sectors		Degradable organic component (BOD) [kg / dm <sup>3</sup> ]	Fraction of wastewater treated by anaerobically method	Maximum methane producing capacity [Gg CH <sub>4</sub> / Gg BOD]
Mining and quarrying		0.001	0.15	0.6
Iron and steel		0.001	0.15	0.6
Non-ferrous metals		0.001	0.15	0.6
Fertilizer		0.004	0.15	0.6
Food products	meat and poultry	0.003	0.15	0.6
	fish processing	0.0015	0.15	0.6
	vegetable & fruit processing	0.002	0.15	0.6
	oil & grease	0.0008	0.15	0.6
	dairy products	0.003	0.15	0.6
	sugar	0.008	0.15	0.6

Non-metallic minerals		0.001	0.15	0.6
Machinery and transportation equipment		0.001	0.15	0.6
Other		0.002	0.15	0.6

### 8.2.2.2. Domestic and Commercial Wastewater (6.B.2)

CH<sub>4</sub> emission from domestic and commercial wastewater was based on methodology [IPCC 1997]. Amounts of degradable organic components for wastewater and for sludge were estimated basing on the data on population connected to sewage treatment plants and on the rate of the each type of sewage treatment plants in municipal wastewater treatment. These data were taken from [GUS 2002d]. Default value of organic load in biochemical oxygen demand per person, which is equal to 60 g BOD/person/day [IPCC 2000], was taken for the calculations. Fraction of BOD that readily settles and is removed as sludge was estimated basing on the report [Bernacka 2005] and its value was 0.946 (for this estimation the country

specific value of BOD = 369 g O<sub>2</sub>/m<sup>3</sup> was used). The emission factors calculated on the basis of the study mentioned above and applied in inventory report are:

- for wastewater: 0.030 kg CH<sub>4</sub> / kg BOD
- for sewage sludge: 0.488 kg CH<sub>4</sub> / kg BOD.

The default value (0.6 kg CH<sub>4</sub> / kg BOD) of maximum methane producing capacity was applied for estimation of sludge and wastewater emission factors. Fractions of wastewater and sludge anaerobically treated with and without methane recovery are estimated according to [Bernacka 2005]. These value are as follows: percentage of wastewater anaerobically treated – 5%, fractions of sludge anaerobically degraded – 81.3% of which with methane recovery – 83.5%.

N<sub>2</sub>O emission from humane sewage was calculated according to default method [IPCC 1997]. Country population was taken from [GUS 2003]. Value of protein consumption per capita per year comes from [FAOSTAT 2006]. Default values were used for fraction of nitrogen in protein and for N<sub>2</sub>O emission factor [IPCC 2000].

### 8.2.3. Waste Incineration (CRF 6.C)

Waste incineration was estimated based on IPCC methodology [IPCC 2000] and domestic case study [Wielgosiński 2003]. Emission factors as default were taken from [IPCC 2000]. The activity data for incinerated municipal, industrial, medical and sewage sludge wastes were adopted following the expert assessment [Wielgosiński 2003a].

## **ANNEXES**

## Annex 1. Key sources

The source categories in all sectors, are identified to be *key sources* on the basis of their contribution to the total level and/or trend uncertainty in accordance with IPCC Good Practice Guidance (IPCC 2000).

From source categories which have been identify as key sources in level assessment, the most important are:

- Stationary combustion Solid Fuels,
- Stationary combustion Liquid Fuels,
- 1.A.3.b Transport Road Transportation.

Emission from these sources made up 73.6% of the total GHG emissions in Poland expressed in units of CO<sub>2</sub> equivalents. Combustion of solid, gaseous and liquid fuels in stationary sources, made up 70.67% of the total GHG emissions. Combustion of solid fuels in stationary sources alone, made up 58.7% of the total GHG emissions.

The most important source categories in level assessment are:

- Stationary combustion Solid Fuels,
- 1.A.3.b Transport Road Transportation,
- Stationary combustion Liquid Fuels.

Share of these sources in national total made up 73.63%.

7.A1 - 7.A3 IPCC Good Practice Guidance tables, concerning level and trend assessment are listed below.

### Level Assessment

		IPCC Source Categories	Direct GHG	Current Year Estimate	Level Assessment	Cumulative Total
1	1.A.1, 2, 4, 5.a	Stationary combustion Solid Fuels	CO <sub>2</sub>	236134.81	0.5872	0.59
2	1.A.1, 2, 4, 5.a	Stationary combustion Liquid Fuels	CO <sub>2</sub>	29986.12	0.0746	0.66

## Annex 2. 2001 Energy balance data for main fuels

Energy balances in 2001 for several main fuels: brown coal, diesel oil, fuel oil, high-methane and nitrified natural gas and coke, are given below. Similar balance data for hard coal are presented in Chapter 1.4.

### Brown coal consumption

Evaluation of fuel consumption In national combustion processes	Brown coal	
	10 <sup>3</sup> Mg	TJ
<b>In</b>	<b>59 553</b>	<b>510 967</b>
From national sources	59 553	510 967
1) Indigenous production	59 552	510 958
2) Transformation output or return	0	0
3) Stock decrease	1	9
Import	0	0
<b>Out</b>	<b>59 553</b>	<b>510 968</b>
National consumption	59 538	515 549
1) Transformation input	59 168	512 198
a) input for secondary fuel production	0	0
b) fuel combustion	59 168	512 198
2) Direct consumption	370	3 351
Non-energy use	0	0
Combusted directly	370	3 351
<b>Combusted in Poland</b>	<b>59 538</b>	<b>515 549</b>
Stock increase	0	0
Export	15	127
Losses and statistical differences		-4 708
Net calorific value	MJ/kg	8.66
CO <sub>2</sub> Emission Factor	kg/GJ	113.50

### Diesel oil consumption

Evaluation of fuel consumption In national combustion processes	Diesel oil	
	10 <sup>3</sup> Mg	TJ
<b>In</b>	<b>5 921</b>	<b>256 506</b>
From national sources	4 946	214 291
1) Indigenous production	0	0
2) Transformation output or return	4 914	212 904
3) Stock decrease	32	1 387
Import	975	42 215
<b>Out</b>	<b>5 921</b>	<b>256 505</b>
National consumption	5 739	248 660
1) Transformation input	581	25 169
a) input for secondary fuel production	581	25 159
b) fuel combustion	0	11
2) Direct consumption	5 158	223 491
Non-energy use	0	0
Combusted directly	5 158	223 491
<b>Combusted in Poland</b>	<b>5 158</b>	<b>223 502</b>
Stock increase	0	0
Export	182	7 845
Losses and statistical differences	0	0
Net calorific value	MJ/kg	43.33
CO <sub>2</sub> Emission Factor	kg/GJ	72.29

## Fuel oil consumption

Evaluation of fuel consumption In national combustion processes	Fuel oil	
	10 <sup>3</sup> Mg	TJ
<b>In</b>	<b>6 671</b>	<b>280 727</b>
From national sources	6 370	268 074
1) Indigenous production	0	0
2) Transformation output or return	6 344	266 937
3) Stock decrease	26	1 137
Import	301	12 653
<b>Out</b>	<b>6 672</b>	<b>280 726</b>
National consumption	4 849	205 358
1) Transformation input	856	35 435
a) input for secondary fuel production	129	5 353
b) fuel combustion	727	30 082
2) Direct consumption	3 993	169 923
Non-energy use	0	0
Combusted directly	3 993	169 923
<b>Combusted in Poland</b>	<b>4 720</b>	<b>200 005</b>
Stock increase	16	653
Export	1 366	56 660
Losses and statistical differences	441	18 055
Net calorific value	MJ/kg	42.37
CO <sub>2</sub> Emission Factor	kg/GJ	75.85

## High-methane natural gas consumption

Evaluation of fuel consumption In national combustion processes	High-methane natural gas	
	10 <sup>6</sup> m <sup>3</sup>	TJ
<b>In</b>	<b>10 995</b>	<b>396 141</b>
From national sources	2 670	94 193
1) Indigenous production	2 088	68 895
2) Transformation output or return	582	25 298
3) Stock decrease	0	0
Import	8 325	301 948
<b>Out</b>	<b>11 035</b>	<b>396 141</b>
National consumption	10 094	364 341
1) Transformation input	1 187	42 683
a) input for secondary fuel production	717	25 814
b) fuel combustion	470	16 869
2) Direct consumption	8 907	321 658
Non-energy use	1 670	60 216
Combusted directly	7 237	261 442
<b>Combusted in Poland</b>	<b>7 707</b>	<b>278 311</b>
Stock increase	345	12 289
Export	39	1 416
Losses and statistical differences	557	18 095
Net calorific value	MJ/m <sup>3</sup>	36.11
CO <sub>2</sub> Emission Factor	kg/GJ	53.66

## Nitrified natural gas consumption

Evaluation of fuel consumption In national combustion processes	Nitrified natural gas	
	10 <sup>6</sup> m <sup>3</sup>	TJ
<b>In</b>	<b>3 278</b>	<b>83 973</b>
From national sources	3 278	83 973
1) Indigenous production	3 090	77 309
2) Transformation output or return	188	6 664
3) Stock decrease	0	0
Import	0	0
<b>Out</b>	<b>3 278</b>	<b>83 974</b>
National consumption	3 239	82 959
1) Transformation input	1 588	41 039
a) input for secondary fuel production	1 281	33 041
b) fuel combustion	307	7 998
2) Direct consumption	1 651	41 920
Non-energy use	0	0
Combusted directly	1 651	41 920
<b>Combusted in Poland</b>	<b>1 958</b>	<b>49 918</b>
Stock increase	0	0
Export	0	0
Losses and statistical differences	39	1 015
Net calorific value	MJ/m <sup>3</sup>	25.49
CO <sub>2</sub> Emission Factor	kg/GJ	55

## Coke consumption

Evaluation of fuel consumption In national combustion processes	Coke	
	10 <sup>3</sup> Mg	TJ
<b>In</b>	<b>8 976</b>	<b>253 132</b>
From national sources	8 946	252 282
1) Indigenous production	0	0
2) Transformation output or return	8 946	252 282
3) Stock decrease	0	0
Import	30	850
<b>Out</b>	<b>8 976</b>	<b>253 132</b>
National consumption	5 052	138 443
1) Transformation input	1 359	37 679
a) input for secondary fuel production	1 299	36 065
b) fuel combustion	60	1 614
2) Direct consumption	3 693	100 764
Non-energy use	91	2 524
Combusted directly	3 602	98 240
<b>Combusted in Poland</b>	<b>3 662</b>	<b>99 854</b>
Stock increase	0	0
Export	3 924	109 884
Losses and statistical differences		4 805
Net calorific value	MJ/kg	27.26
CO <sub>2</sub> Emission Factor	kg/GJ	113.77

## Annex 5. Uncertainty estimation of the 2001 inventory

Uncertainty analysis for the year 2001 was performed with Tier1 methodology. This simplified methodology is based on the assumptions listed below:

- every value is independent (there is no correlation between values)
- probability distribution is symmetric (probability of underestimation and overestimation is the same)

Conclusions from the 2005 in-depth review of the Polish GHG emission inventory were taken into account and additional analyses were made in *Agriculture* sector. For sector 5. *LUFC* and *Industrial gases* (HFC, PFC, SF<sub>6</sub>) due to lack of appropriate information, uncertainty estimates were made directly to emission values.

First step of the analysis was to assign uncertainty to each activity and emission factor. Next step was to estimate error propagation and its influence of total results. To estimate error propagation from activity and emission factor to emission values, formula (1) was used.

$$U_{\text{emission}} = \text{square root } (U_{\text{act}}^2 + U_{\text{EF}}^2) \quad (1)$$

where:  $U_{\text{emission}}$  – uncertainty of emission value

$U_{\text{act}}$  – uncertainty of activity value

$U_{\text{ef}}$  – uncertainty of emission factor value

To estimate error propagation from sectoral emissions to national total, formula (2) was used

$$U_{\text{emission}} = \text{square root } (\Sigma (\text{Emission} * U_{\text{emission}})^2) / \Sigma \text{Emission} \quad (2)$$

where:  $U_{\text{emission}}$  – uncertainty of emission value in sector

Emission – emission from sector

As the base bottom level of analysis the following sectors were chosen:

- sector 1: levels 1.A.1, 1.A.2, 1.A.3., 1.A.4, 1.A.5 with disaggregation by fuel type (liquid, solid, gaseous, biomass etc.)
- sector 2: levels 2.A.1, 2.A.2 ..... 2.C.3. (no estimates of emission from 2.D and 2.E)
- sector 4: 4.A.1, 4.A.2 ..... 4.F.5
- sector 6: 6.A.1, 6.A.2; 6.B with disaggregation according to wastewater types and 6.C with disaggregation according to waste types.

To estimate uncertainty of input data, the results of research made in 2000 for the 1998 GHG emission inventory were used. These data were assigned for emission factors for CH<sub>4</sub> and N<sub>2</sub>O in sector 1. *Energy*, 4. *Agriculture* and partly in 6. *Waste*. Another source of data on uncertainties was analysis of 2002 GHG Inventory of Scandinavian countries. Conclusions were applied to activities in sector 1. *Energy* and for activities and emission factors in sector 2. *Industrial processes*. Other uncertainties for activities and factors were estimated with expert's opinion in National Emission Centre in Warsaw (CO<sub>2</sub> emission factors in sector 1. *Energy*; and activities and factors in 6.C Waste/Waste Incineration).

Results of analysis of error propagation of uncertainty of national totals are shown below:

CO <sub>2</sub> – 7.0%	CH <sub>4</sub> – 22.0%	N <sub>2</sub> O – 48.4%
HFC – 43.7%	PFC – 20.0%	SF <sub>6</sub> – 100.0%

## Activities

Most uncertain values of activity were assigned in category *4.F Agriculture/Field Burning of Agricultural Residues* and in *6.B Waste/Domestic and Commercial Wastewater* (30%). Lowest uncertainty values were assigned to *1.B Fugitive emission from fuels* (2%) and in *1.A.1 Energy/ Fuel Combustion/ Energy Industries* (3%).

## CO<sub>2</sub> emission factors

Most uncertain values for CO<sub>2</sub> emission factors were assigned in sector *6.C Waste incineration* (50%), *2.A. Cement Production* (15%) and *2.C Metal Production* (10%), the most precise values were in *1.A Fuel Combustion* (1-2%).

Low level of uncertainty of national total of CO<sub>2</sub> (7.0%) comes from the fact, that major part of emission comes from sector *1.A Fuel Combustion* where data for activities and factors are most precise (relatively 2-5% and 1-2%).

## CH<sub>4</sub> emission factors

Most uncertain values for CH<sub>4</sub> emission factors were assigned in sector *6.A Solid Waste Disposal on Land* (100%), and *6.B. Wastewater Handling* (100%), *4.A. Enteric Fermentation* and *4.B Manure Management* (50%), *1.A.3 Transport* (50%), and for liquid fuels in *1.A Fuel Combustion* (41,8%), the most precise values were in *1.B.2 Fugitive emission from fuels/ Oil and natural gas* (8.1%).

Uncertainty of CH<sub>4</sub> emission is app. 22.0% which is result of share of agriculture and waste sectors in national totals – emission factors in those sectors have high uncertainty.

## N<sub>2</sub>O emission factors

Most uncertain values for N<sub>2</sub>O emission factors were assigned in sector *4.B.11* and *4.B.12 Manure management* (150%), *4.D Agricultural Soils* (150%) and in *4.F Agriculture/Field Burning of Agricultural Residues* (150%), most precise values were for Natural gas combustion in *1.A.3 Transport* (2.3%) and *1.A Fuel Combustion* (3.8%).

Highest value of uncertainty of national total occurred in N<sub>2</sub>O (48.4%) and is a result of high uncertainty of the emission factors in sector of *Agriculture* (*4.B.11 Liquid systems*, *4.B.12 Solid Storage and Dry Lot*, *4.D Agricultural Soils* and *4.Field Burning of Agricultural residues* – 150%).

## Industrial Gases

Simplified analysis were made for industrial gases HFC, PFC and SF<sub>6</sub> – uncertainty estimates were applied directly to emission values of each pollutant. Results are HFC – 43.7%, PFC – 20.0%, SF<sub>6</sub> – 100.0%. Due to lack of information, additional analysis need to be done for these gases.

The uncertainty assessment of GHG Inventory for 2001 was made on the basis of calculations and experts opinions made in 2006 (during compiling inventories for years 2000-2004) and recommendations of the UNFCCC expert review team. The calculations were extended to cover simplified approach for LULUCF sector and industrial gases.

Sector *3. Solvents and Other Products Use* was included in calculations with high sectoral uncertainty 28.3%. Emission from this sector is small (513.21 Gg) compared to total CO<sub>2</sub> and high uncertainty have very little influence on uncertainty of values of total national CO<sub>2</sub> emission.

## GHG inventory 2001 – Uncertainty analysis, part 1, sectors 1-2

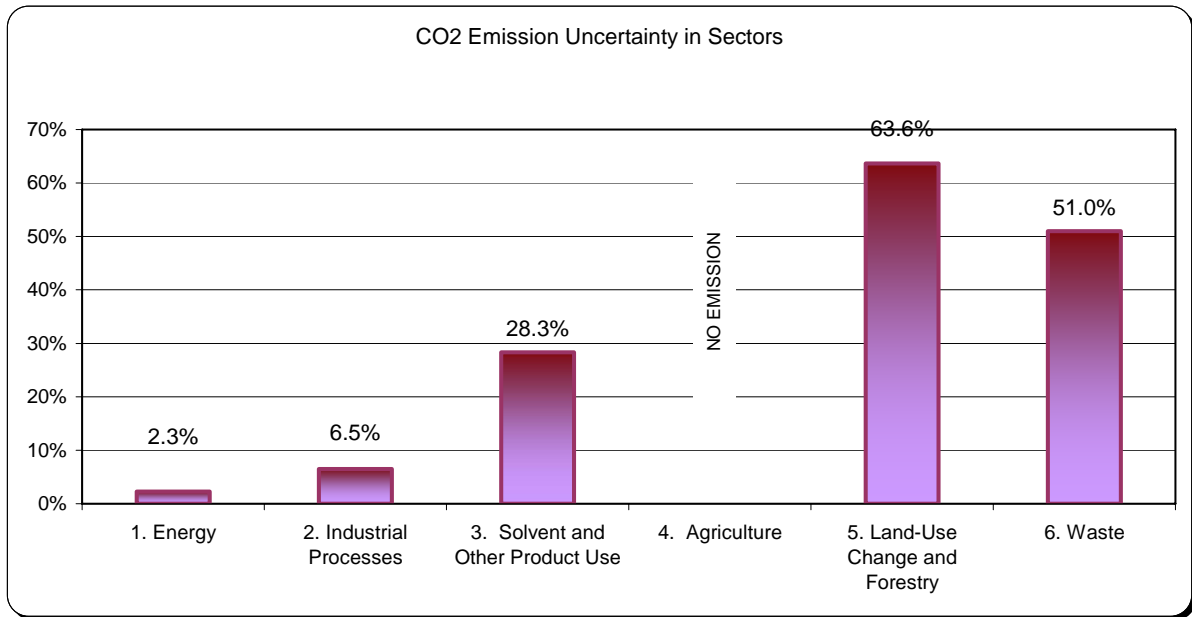

2001	Activity [TJ]	Activity uncertainty [%]	EF CO2 [t/TJ]	EF CH4 [kg/TJ]	EF N2O [kg/TJ]	EF CO2 Uncertainty [%]	EF CH4 Uncertainty [%]	EF N2O Uncertainty [%]	CO2 [Gg]	CH4 [Gg]	N2O [Gg]	CO2 Emission uncertainty [%]	CH4 Emission uncertainty [%]	N2O Emission uncertainty [%]	CO2 Emission absolute uncertainty [Gg]	CH4 Emission absolute uncertainty [Gg]	N2O Emission absolute uncertainty [Gg]
