### BIENNIAL UPDATE REPORT TO THE UNFCCC

# Malaysia

## BIENNIAL UPDATE REPORT TO THE UNFCCC

This is Malaysia's First Biennial Update Report submitted to the United Nations Framework Convention on Climate Change in December 2015.

The softcopy version of the report is available at nre.gov.my.

A Publication by the MINISTRY OF NATURAL RESOURCES AND ENVIRONMENT MALAYSIA Kementerian Sumber Asli dan Alam Sekitar Malaysia Wisma Sumber Asli, No. 25 Persiaran Perdana, Presint 4 62574 PUTRAJAYA, MALAYSIA

#### CHEMICAL ELEMENTS

| С | carbon    |
|---|-----------|
| К | potassium |
| Ν | nitrogen  |

P phosphorous

#### GASES

| CFC              | chlorofluorocarbon   |
|------------------|----------------------|
| $CF_4$           | tetrafluoromethane   |
| $C_2F_6$         | hexafluoroethane     |
| CO <sub>2</sub>  | carbon dioxide       |
| CH4              | methane              |
| HFC              | hydrofluorocarbon    |
| N <sub>2</sub> O | nitrous oxide        |
| PFC              | perfluorocarbon      |
| SF <sub>6</sub>  | sulphur hexafluoride |
|                  |                      |

## FOREWORD

It gives me great pleasure to present to you Malaysia's first Biennial Update Report (BUR) to the United Nations Framework Convention on Climate Change (UNFCCC). This document provides an update on the information contained in Malaysia's Second National Communication (NC2) which was submitted to the UNFCCC in January 2011. The BUR contains information on national greenhouse gas inventory for 2011 and time series information where possible from 1990. Apart from the listing of mitigation actions and their effects, the report also provides an overview of the programmes that are beneficial to mitigation of climate change that the country would be implementing in its development plan up to 2020.

At the 15<sup>th</sup> Conference of Parties (COP15) in Copenhagen, our Prime Minister announced that Malaysia would voluntarily reduce its emissions intensity of gross domestic product (GDP) by up to 40% by 2020 based on 2005 levels. This initiative, which is conditional to technology transfer and financial support from developed countries, demonstrates Malaysia's commitment to addressing greenhouse gas (GHG) emissions in the context of sustainable development. Being a tropical country with abundant rainfall, forest has been among our natural heritage. We are committed to maintaining at least 50% of the country with forest cover. In this regard, in 2011, the GHG emission intensity per unit of GDP, taking into account Land Use, Land-Use Change and Forestry (LULUCF) emissions only, has improved by approximately 23% compared with 2005 levels. With the inclusion of removals by LULUCF, the GHG emission intensity per unit GDP had improved by 32% in 2011 compared with 2005 levels.

Malaysia's BUR would not have been possible without the cooperation and commitment of numerous experts and stakeholders and the contributions of valuable data from government ministries, agencies, research organisations, industries, industry associations, universities and non-governmental organisations. My sincere thanks also go to the National Steering Committee, Technical Working Groups and Sub-Working Groups for their hard work and dedication in making this report possible. I would also like to take this opportunity to thank the UNFCCC, Global Environment Facility (GEF) and United Nations Development Programme (UNDP) for providing the funds for this report.

**DATO' SRI DR HA, I WAN JUNALET TUANKU JAAFAR** Minister of Natural Resources and Environment, Malaysia

#### **EXECUTIVE SUMMARY**

#### Introduction

This Biennial Update Report (BUR) has been prepared to meet Malaysia's obligations as a Party to the United Nations Framework Convention on Climate Change (UNFCCC). As a non-Annex I Party, the BUR is submitted to meet Malaysia's reporting requirements under Article 4, paragraph 1(a) and Article 12 of the Convention and Decision 1/CP.16.

The BUR provides an update on Malaysia's Second National Communication (NC2), which was submitted to the UNFCCC in 2011. In accordance with the Guidelines in Annex III of Decision 2/ CP.17, the BUR comprises the following:

- Chapter 1 provides updated information on national circumstances and institutional arrangements;
- · Chapter 2 is an update on the national greenhouse gas inventory;
- Chapter 3 provides information on mitigation actions and their effects;
- Chapter 4 describes the level of support received, including information on the support received to enable the preparation and submission of the BUR;
- Chapter 5 highlights the constraints and gaps, and related financial, technical and capacity needs; and
- Chapter 6 provides other information on addressing climate change.

The BUR is a Government of Malaysia output of the United Nations Development Programme-Global Environment Facility (UNDP-GEF) Project, Third National Communication to the UNFCCC and Biennial Update Reporting for Malaysia. The BUR builds on the NC2 process.

#### 1. National Circumstances

Information is provided on national circumstances up to the year 2013 for the sectors where published statistics are available. Over the past four decades, increasing temperature trends have been observed.

The total population of Malaysia in 2011 was estimated at 29.1 million. This grew to 29.9 million in 2013. Population increased by 24.9% over the period 2000-2011. Malaysia launched the Economic Transformation Programme (ETP) in 2010 to catalyse investment and economic growth. GDP (at 2005 constant prices) grew from RM543.6 billion in 2005 to RM711.8 billion in 2011 and RM787.6 billion in 2013.

Primary energy supply and energy demand are expected to grow with population and economic growth. Recent policies have focussed on reducing dependency on petroleum products and mainstreaming environmental considerations, while ensuring reliable, affordable energy and safeguarding energy security. The promotion of renewable energy remains a priority for Malaysia, as evidenced by enforcement of Renewable Energy Act 2011 and implementation of Feed-in Tariff (FiT) scheme. In the Eleventh Malaysia Plan, new renewable energy resources such as wind and geothermal energy will be explored in diversifying the energy mix.

The Land Public Transport Commission (SPAD) was established in 2010 to provide a holistic solution to land public transport system in cities. Efforts are underway to reduce traffic congestion by extending the light rail transit (LRT) system and developing the Klang Valley Mass Rapid Transit (KVMRT) project.

Oil palm is the most economically important agricultural crop. Sustainable practices have been introduced, including utilisation and optimisation of idle agriculture land, and product certification. As of 2011, about 5 million ha have been planted with oil palm; however, the ETP National Key Economic Area (NKEA) suggests that the potential arable land for oil palm cultivation is limited and therefore enhancement of productivity is a key target. Other agricultural crops of significant hectarage are rubber and paddy. Overall livestock population, landings of marine fish and aquaculture production increased in the period 2000-2011. Key data on these for 2011 is provided in Appendix 1.

Malaysia has taken a stepwise approach to privatise and centralise its solid waste management. In 2012, the average waste generation per capita per day increased compared with 2007. Food residues are the biggest contributor (45%), while plastics decreased from 24% to 13.2% and paper increased from 7% to 8.5%, from 2005 to 2012.

Finally, in terms of institutional arrangements, the National Green Technology & Climate Change Council, chaired by the Hon. Prime Minister of Malaysia, was established to provide a platform for high-level decision-making on climate change. Operational matters are guided and endorsed by a National Steering Committee on Climate Change (NSCCC). Technical Working Groups were established under the National Communication and Biennial Update Report National Steering Committee (NCBURNSC) which reports to NSCCC to prepare national communications and biennial update reports to the UNFCCC. In addition, the National Steering Committee on REDD+ (NSCREDD) was established in 2011 to guide the development of a national REDD+ strategy for implementation.

#### 2. National Greenhouse Gas Inventory

The greenhouse gas (GHG) inventory details the anthropogenic emissions and removals for the year 2011 for five sectors: energy; industrial processes; agriculture; land use, land-use change and forestry (LULUCF); and waste. The inventory also contains time series estimates that were recalculated to reflect updated activity data. Total GHG emissions were 290.23 Mt  $CO_2$ eq and net emissions were 27.28 Mt  $CO_2$ eq as presented in Table ES 1.

| Sector                             | Emissions (Mt CO <sub>2</sub> eq) | Sink (Mt CO <sub>2</sub> eq) |
|------------------------------------|-----------------------------------|------------------------------|
| Energy                             | 218.914                           |                              |
| Industrial Processes               | 18.166                            |                              |
| Agriculture                        | 15.775                            |                              |
| LULUCF                             | 2.490                             | - 262.946                    |
| Waste                              | 34.885                            |                              |
| Total                              | 290.230                           | - 262.946                    |
| Net Total (after subtracting sink) | 27.284                            |                              |

#### Table ES 1: GHG Inventory for 2011

Apart from the LULUCF sector, which was a major source in the inventory reported in NC2, emission contributions between sectors were similar to those reported in that report. For 2011, the energy sector was the highest contributor to GHG emissions at 76%, followed by the waste sector at 12%,

industrial processes sector at 6%, agriculture sector at 5% and LULUCF emissions at 1%. Emissions in the energy sector increased by 48%, industrial processes sector by 46%, agriculture sector by 35%, waste sector by 45% and LULUCF net removals increased by 14% between the years 2000 and 2011. Carbon dioxide (CO<sub>2</sub>) emissions amounted to 72% of total GHG emissions in 2011 and methane (CH<sub>4</sub>) and nitrous oxide (N<sub>2</sub>O) emissions amounted to 23% and 5% respectively. Over the same period, CO<sub>2</sub> emissions including LULUCF emissions only, increased by 31%, CH<sub>4</sub> emissions by 37% and N<sub>2</sub>O emissions by 44%.

Three different approaches were used to calculate the GHG emission intensity indices. With LULUCF emissions, GHG emissions per capita and per GDP were 9.974 t  $CO_2$ eq/capita and 0.4078 t  $CO_2$ eq/thousand RM respectively in 2011. Compared with 2005 levels, GHG emissions per capita decreased by 9.8% while GHG emission intensity of GDP decreased by 23%. Taking into consideration both LULUCF emissions and removals, GHG emissions per capita and per GDP were 0.938 t  $CO_2$ eq/capita and 0.0383 t  $CO_2$ eq/thousand RM respectively in 2011. Under this approach GHG emissions per capita and per GDP decreased by 20.7% and 32.5% respectively compared to 2005 levels. The population and GDP increased by 11.5% and 30.9% respectively over the same period.

#### 3. Mitigation Actions and Effects

In 2009, Malaysia announced it would voluntarily reduce GHG emission intensity of GDP by up to 40% by 2020 as compared with 2005 levels, conditional upon receiving technology transfer and adequate financing from developed countries. This chapter links Malaysia's policies and programmes with specific mitigation actions and their effects. However, only a subset of the measures could be adequately quantified in terms of GHG emission reductions. Table ES 2 shows that in 2013, a total of 18.57 million t CO<sub>2</sub>eq emissions were reduced.

| Sector | Mitigation Action   | Emission Reduction<br>Achieved in 2013<br>(kt CO₂eq) | Potential Emission<br>Reduction in 2020<br>(kt CO <sub>2</sub> eq) |  |
|--------|---|--|--|--|
|        | RE implementation through Feed-in Tariff mechanism  | 252.78   | 5,458.09   |  |
|        | RE electricity generation by non Feed-in Tariff regulated public and private licensees and other mechanisms         | 948.77   | 2,179.29   |  |
|        | Use of palm-based biodiesel in blended petroleum diesel   | 719.74   | 1,802.49   |  |
|        | Application of green technology   | 94.81  | 1,426.35   |  |
| Energy | Implementation of green building rating scheme  | 60.40  | 858.40   |  |
|        | Efficient electricity consumption in all Federal<br>Government ministry buildings (baseline<br>established in 2013) | -  | 98.21  |  |
|        | Reducing emissions through development and usage of energy-efficient vehicles (EEVs)                                | 40.96  | 199.74   |  |
|        | Use of compressed natural gas (CNG) in motor vehicles   | 154.62   | 217.57   |  |

| LULUCF | Sustainable forest management   | 13,797.37  | 13,800.00  |  |
| Waste  | Waste paper recycling   | 1,993.47   | 2,159.45   |  |
|        | Biogas capture from palm oil mill effluent (POME) treatment   | 300.95   | 3,001.89   |  |
|        | Total   | 18,578.80  | 32,178.99  |  |

| Table ES 2: Summary of Emissions Reduction Achieved in 2013 and Projected for | 2020 |
|---|------|
|---|------|

The measurement, reporting and verification (MRV) of mitigation actions in Malaysia are coordinated by the Ministry of Natural Resources and Environment (NRE). Mitigation action data are collated by the Technical Working Group (TWG) on Mitigation, and verification is conducted by the Technical Working Group on Verification under the National Steering Committee on Climate Change. Guidelines for MRV are being developed and tested.

Malaysia has benefited from investments in GHG emissions reduction projects through participation in the Clean Development Mechanism (CDM) under the Kyoto Protocol. As of April 2015, Malaysia has a total of 143 registered CDM projects. Up to the end of the first Kyoto commitment period, the projects were expected to yield 23.95 million t CO<sub>2</sub>eq emissions reduction. Malaysia has also participated in 11 voluntary carbon market projects.

#### 4. Level of Support

As per Article 4.3 of the UNFCCC, Malaysia has received capacity building, technical and financial support from international sources to enable the country to fulfil its obligations under the Convention and to better implement actions to address climate change. In the chapter, the support received by federal agencies to specifically address climate change is described, while the support received at sub-national level is reported to the extent possible. The manner in which international funds have been channelled has, however, not enabled tracking and clear identification of the support.

The bulk of the financial support has been provided through the GEF, the operating entity of the financial mechanism of the UNFCCC. Since the entry into force of the UNFCCC, the total amount of funding received from GEF for climate change activities up to June 2014 is USD46,510,020.

The support received has focused mainly on enhancing Malaysia's institutional and technical capacity on reporting obligations to the UNFCCC and on implementing mitigation actions. This has been channelled through the UNDP and the United Nations Industrial Development Organisation (UNIDO) in Malaysia.

Financial support of USD352,000 was provided for the preparation of the BUR, which also enabled the development of the national GHG inventory and the mitigation analysis. Additional funding contributed to capacity building and the development of the MRV system.

In the area of forests, a REDD+ readiness programme was supported. Two initiatives with a regional focus paid particular attention to the strengthening of institutional capacity in technical and policy issues with regard to the potential implementation of REDD+ activities. Other forest-related support included external consultancy expertise for institutional capacity building, and for sustainable forest management and community development.

Malaysia has also received capacity building support from the Intergovernmental Panel on Climate Change (IPCC) and a number of Annex 1 Parties. Japan and the United States have helped enhance the technical capacity of Malaysia's GHG inventory compilers.

#### 5. Constraints Gaps, and Needs

This chapter describes the constraints, gaps and related needs for GHG inventory, mitigation, vulnerability and adaptation, and research and systematic observation. These are summarised and presented in Appendix 2. Many constraints and gaps exist for the various GHG emitting economic

sectors, particularly in terms of technical and capacity gaps. Malaysia also faces challenges in adapting to the impacts of climate change while ensuring that development gains are protected. It is critical that the constraints and gaps hindering more systematic and widespread uptake of both mitigation and adaptation efforts are concurrently addressed to avoid loss of mitigation gains.

In general, there are persistent constraints in the areas of institutional arrangements, and in the regulatory and financial support needed to create an enabling environment for mitigation action. All efforts require substantial and continued technical capacity development, financial assistance and as appropriate, international collaboration.

#### 6. Other Information on Addressing Climate Change

Information on several cross-cutting and other initiatives that are addressing climate change is provided in this chapter. This is in addition to the policies described in Chapter 3. The areas addressed are a framework of low-carbon or green cities, Government Green Procurement (GGP) and National Corporate Greenhouse Gas Reporting Programme for Malaysia (also known as MyCarbon).

While concrete efforts have been undertaken thus far, real challenges remain in ensuring policy coherence. There is also an urgent need for better coordination across the various ministries and agencies. In addition, proper implementation of the policies in order to yield concrete results remains a substantial challenge. Additional and timely international assistance in the forms of financing, technology transfer and capacity building would help shift Malaysia on its path towards low-carbon economic development more quickly and more substantially.

#### INTRODUCTION

This Biennial Update Report (BUR) is prepared to meet Malaysia's reporting obligations to the United Nations Framework Convention on Climate Change (UNFCCC) in line with Decision 1/CP.16 and following the guidelines in Annex III of Decision 2/CP17. The report contains an update of the National Circumstances until 2013 in Chapter 1. This is followed by a description of the Greenhouse Gas (GHG) Inventory for 2011, with time series GHG emissions information in Chapter 2. Mitigation Actions and their Effects for 2013 are contained in Chapter 3. A brief description of the Level of Support received for climate change from international sources is provided in Chapter 4. Constraints, Gaps and Needs for addressing climate change and Additional Information on Addressing Climate Change are presented in Chapters 5 and 6 respectively.

The preparation of the report was funded by the United Nations Development Programme-Global Environment Facility (UNDP-GEF) Project on Third National Communication to the UNFCCC and Biennial Update Report for Malaysia (NC3/BUR Project). The overall NC3/BUR Project budget USD1,656,450, with USD852,000 from GEF, USD300,000 cost sharing by the Government of Malaysia, USD404,450 in-kind from the Government and USD100,000 in-kind from UNDP. This is for both the preparation of this BUR and the NC3 including BUR2 due in 2017. Of the USD852,000 from GEF, USD352,000 is for the preparation of this BUR.

This BUR preparation constituted the first part of the NC3/BUR Project. During this phase, strong emphasis was placed on updating the GHG Inventory, quantification of mitigation actions and their effects and establishing a sustainable and low cost Measurement, Reporting and Verification (MRV) system for mitigation actions.

The NC3/BUR process is conducted under the stewardship of the Ministry of Natural Resources and Environment, Malaysia (NRE). Consequently, NRE chairs both the Project Management Group and the Project Steering Committee. Technical guidance is provided by six Technical Working Groups (TWG), these being on GHG Inventory, Mitigation, MRV, Vulnerability and Adaptation (V&A), Socio Economic Aspects of Climate Change, and Research and Systematic Observation (RSO). The main technical work for the BUR/NC is carried out by Sub-Working Groups (SWG) constituted under each of the TWGs, assisted as necessary by consultants. The institutional arrangement for NC3/BUR is discussed in greater detail in section 1.11 of Chapter 1: National Circumstances.

The report preparation process has helped Malaysia further develop its institutional arrangements for the preparation of NC/BUR. The project structure required direct involvement from a wide pool of stakeholders representing a broad range of government agencies, the private sector, research institutions, non-governmental organisations (NGOs) and academic institutions. This exercise has therefore strengthened the coordination, capacity and capability of the TWGs and enlarged the pool of experts, in particular for GHG inventory development. Numerous meetings and workshops were held by each TWG and its SWGs. This process, while time consuming, has helped fill data gaps and resolve data inconsistencies. It has also increased participating stakeholders' knowledge and strengthened collaboration on climate change.

In the Eleventh Malaysia Plan (2016-2020), one of the main thrusts is on 'Pursuing Green Growth for Sustainability and Resilience'. The strategies to embark on green growth were highlighted in the

three accompanying namely Strategy Paper 11: 'Climate Resilient Development'; Strategy Paper 12: 'Growth through Sustainable Use of Natural Resources'; and Strategy Paper 17: 'Sustainable Usage of Energy to Support Growth'. These papers focussed on prudent and efficient management of resources by adopting the sustainable consumption and production concept. Hence, climate change actions are already being mainstreamed into national development to realise adaptation and mitigation co-benefits from all sectors of the economy. Awareness of the need to quantify mitigation actions and their effects is increasing among the government agencies and the private sector; however, the institutional arrangements for MRV are still under development.

## NATIONAL CIRCUMSTANCES

## CHAPTER 1: NATIONAL CIRCUMSTANCES

This chapter updates information on national circumstances up to the year 2013 for the sectors where published statistics are available. The information contained in this chapter was used for the assessment in the rest of the report.

#### 1.1 Geography: Location & Topography

Malaysia is a nation located in Southeast Asia and together with its territorial waters lie between 0° 51′ N and 7° 33′ N, and 98° 01′ E and 119° 30′ E. It consists of 13 states and three Federal Territories. Eleven of the states and two of the Federal Territories (of Kuala Lumpur and Putrajaya) are in Peninsular Malaysia, and these are separated by the South China Sea from the states of Sabah and Sarawak in the island of Borneo. The Federal Territory of Labuan consisting of the whole island of Labuan is located off the coast of western Sabah. Malaysia has an area of approximately 330,803 km<sup>2</sup>, with about 5,267 km of coastline and over 879 islands.

The topography of Peninsular Malaysia ranges from coastal areas to mountainous regions. It has a land area of approximately 132,631 km<sup>2</sup> and a coast length of about 1,938 km. Its northsouth extent is about 746 km and its maximum east-west width is about 315 km. The central mountainous spine known as the Titiwangsa Range extends from north to south for about 617 km in length and reaches 2,183 m above sea level. It divides the peninsula between its east and west coasts. The main trunk of the Pahang River at 482 km is the longest river in Peninsular Malaysia and the third longest in Malaysia. The Federal Territory of Labuan has a land area of about 91 km<sup>2</sup>.

Sabah lies on the northeastern part of Borneo Island and has a land area of approximately 73,631 km<sup>2</sup>. It has a coastline of approximately 2,155 m. The topography of Sabah is mountainous, especially in the west coast, with undulating lowland basins in the eastern part. The Crocker Range divides the western coastal plains from the rest of Sabah. Mount Kinabalu, the highest mountain in Malaysia at 4,095 m above sea level, is part of the Crocker Range. The main trunk of the Kinabatangan River at 568 km is the longest river in Sabah and the second longest in Malaysia.

Sarawak with a land area of approximately 124,450 km<sup>2</sup>, lies on the north central and western parts of Borneo Island. It has a coastline of about 1,109 km. The topography of Sarawak shows flat coastal plains followed by a narrow belt of hills before sharply rising into

a mountainous region towards the Kalimantan border. Mount Murud is its highest peak at 2,422 m, followed by Mount Mulu at 2,377 m. Mount Mulu has the largest natural limestone cave system in the world. The main trunk of the Rejang River at 780 km is longest river in Sarawak and Malaysia.

#### 1.2 Governance

Malaysia is a federation of 13 states operating within a constitutional elective monarchy based on the Westminster parliamentary system. The Head of State is the Yang Di-Pertuan Agong, also known as the King, and is elected from among the nine monarchial states for a fiveyear term. The heads of state for the states of Kedah, Perak, Selangor, Johor, Pahang, Terengganu and Kelantan are their respective Sultans, while the heads of state for the states of Negeri Sembilan and Perlis are the Yang Di-Pertuan Besar and Raja respectively. The heads of state of the other four states, namely Penang, Malacca, Sarawak and Sabah, are called Yang Di-Pertua Negeri, sometimes referred to as Governor. They are appointed by the Yang Di-Pertuan Agong for a renewable four-year term, on the advice of the Prime Minister in consultation with the state governments.

Legislative power is divided between federal and state legislatures. At the federal level, Malaysia's bicameral Parliament consists of the Dewan Rakyat (House of Representatives) and Dewan Negara (Senate). The 222 members of the House of Representatives are elected in a general election, due every five years. The Dewan Negara consists of 70 senators of which 26 are elected by the state legislative assemblies (that is, two senators from each state in the Federation), and the remaining 44 are appointed by the Yang Di-Pertuan Agong on the advice of the Prime Minister. The term of office for each of the senator is three years and may only be reappointed once.

The Prime Minister of Malaysia is the Head of Government and the Cabinet. The Prime Minister must be a member of the House of Representatives, and comes from the majority party in Parliament. The Cabinet is also chosen from members of the majority party from both houses of Parliament and has executive powers.

At the state level, the unicameral state legislative assemblies are also elected every five years. The head of government for each of the nine monarchial states is the Menteri Besar, and for the four remaining states the Chief Minister. They are chosen from the majority party in their respective legislative assemblies. Local governments are administered by municipal councils, where councillors are appointed by the respective State Governments.

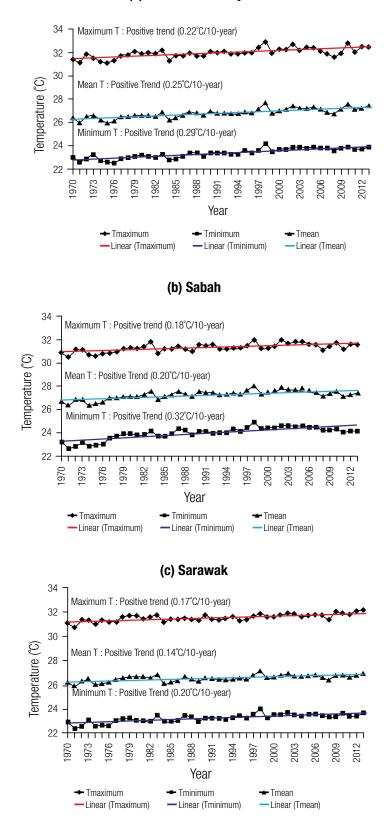

The highest court in the judicial system is the Federal Court headed by the Chief Justice, followed by the Court of Appeal, and two High Courts, namely the High Court in Malaya and the High Court in Sabah and Sarawak. The Subordinate Courts consist of Sessions Courts and Magistrate's Courts. There are also the Syariah (Muslim religious) Courts having limited jurisdiction over matters of state Islamic law. There are also specialised courts such as Children's Court, Native Courts and the recent Environmental Court.

Generally the Federal Government has overall responsibility for environmental matters, but the State Governments have jurisdiction over the management of natural resources, especially land, forestry and water.

#### 1.3 Climate

Malaysia has an equatorial climate with relatively uniform diurnal variations of temperatures throughout the year. The daily mean temperature is between 26°C and 28°C. At the lowlands, temperatures are between 22.5°C during the night and 33°C during daytime. Over the past 43 years, positive trends in temperature increase have been observed. Figure 1.1 shows the annual trends of temperature for Peninsular Malaysia, Sabah and Sarawak from 1970 to 2013. The surface

#### Figure 1.1: Annual Temperature Trends for Peninsular Malaysia, Sabah and Sarawak

#### (a) Peninsular Malaysia

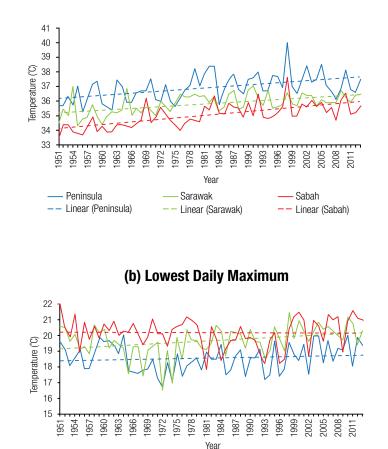

Source: Malaysian Meteorological Department

mean temperature increase is around 0.14°C to 0.25°C per decade. The surface maximum temperature increase is around 0.17°C to 0.22°C per decade, and the surface minimum temperature increase is around 0.20°C to 0.32°C per decade.

The highest daily maximum and lowest daily minimum temperatures for each year from 1951 to 2013 from 12 meteorological stations in Peninsular Malaysia, three meteorological stations in Sabah and four meteorological stations in Sarawak are shown in Figure 1.2. The highest daily maximum temperature shows an increasing trend in Peninsular Malaysia, Sabah and Sarawak. The highest daily maximum temperature is the highest over Peninsular Malaysia, followed by Sarawak and Sabah. The lowest daily minimum temperature, however, shows a different trend. Sabah records a decreasing trend whereas Peninsular Malaysia and Sarawak show an increasing trend.

The winds over the country are generally light and variable. There are, however, some uniform periodic changes in the wind flow patterns. Northeasterly winds prevail during the boreal winter monsoon (locally known as the northeast monsoon) from November to March. Southwesterly winds prevail during the boreal summer monsoon (locally known as the southwest monsoon) from May to September. These monsoons are separated by two shorter inter-monsoon periods.

Rainfall distribution is greatly influenced by topography and the monsoon winds. These features have enabled Malaysia to be blessed with abundant annual rainfall, with average ranging from about 2,000 mm to 4,000 mm. During the northeast monsoon, the east coast of Peninsular Malaysia, northeast of Sabah and southern Sarawak can sometimes experience spells of heavy rain lasting about three days, sometimes resulting in severe floods. Comparatively, the southwest monsoon is drier. During the inter-monsoon periods, heavy rain from convective showers and thunderstorms occur in the late afternoons and evenings. Figure 1.3 shows the annual rainfall for Peninsular Malaysia, Sabah and Sarawak from 1951 to 2013. For this period, there is a very slight decreasing trend in the rainfall for Peninsular Malaysia and Sabah, whereas for Sarawak, there is a slight increasing trend. For a shorter time frame from 1990 onwards, increasing trends in rainfall are observed for Peninsular Malaysia, Sabah and Sarawak.

Clouds cut off a substantial amount of direct sunlight in the afternoons and evenings and Malaysia receives about six hours of direct sunlight per day.

#### 1.4 Forests and Land Use

Forest ecosystems play a major role in global carbon cycle. Forest ecosystems are also important for water regulation and flood management in river basins. They are also a source of timber products, income for the rural populations as well as home to local ethnic peoples.

Malaysian forests are complex ecosystems and rich in species. In 2000, approximately 56% of the total land area of Malaysia was still forested. This included permanent reserved forest (PRFs), state land forests (SLF) and totally protected areas (TPA/PA). In 2011, 17.931 million ha, or approximately 54.3% of the total land area of Malaysia, was still forested. The remaining comprises areas of agricultural crops, rubber plantations, oil palm plantations, urban or other uses. Table 1.1 below presents a breakdown of the total forested areas in Malaysia.

The management of all type of forests is enshrined in the National Forestry Policy 1978 (revised 1992) (NFP) or other relevant State Forest Policies. The NFP was approved by the National Forestry Council in 1977, and later endorsed by the National Land Council in 1978. This policy provided for greater uniformity in the implementation of strategies for the achievement of forest conservation, management as well as social and educational needs. It represents an important policy framework, which is unequivocal in maintaining that forest management must fulfil environmental and conservational needs besides meeting rational economic production goals. It provides guidelines and strong emphasis on the necessity for sound management, conservation, utilisation, development and protection of the forests. This commitment is duly recognised and given specific attention by the National Forestry Act 1984 (revised 1993) (NFA). In Sabah, the necessary legal backing is provided by the Sabah Forest Enactment 1968 while in Sarawak the Sarawak Forest Ordinance 1958 provides the necessary legal framework.

To ensure sustainable forest management, a National Committee on Sustainable Forest Management in Malaysia comprising representatives from various agencies in the forestry sector was formed in 1994 to ensure that the International Tropical Timber Organisation's (ITTO) Criteria and Indicators on sustainable forest management are fully implemented.

To ensure sustainable harvesting of timber, a forest certification scheme was started from 2002 with the adoption of the Malaysian Criteria and Indicators for forest management certification. The maximum cutting limit has been capped at 85 m<sup>3</sup>/ha. The Malaysian Timber Certification Council was established in October 1998 as an independent organisation to develop and operate the Malaysian Timber Certification Scheme (MTCS). The MTCS provides for independent assessment of forest management practices, to ensure the sustainable management of Malaysia's natural forest as well as to meet the demand for certified timber products. As of August 2014, about 4.7 million ha of natural forest have been certified.

| Year                | 2000   | 2005   | 2010   | 2011   | 2012   | 2013   |
|---------------------|--------|--------|--------|--------|--------|--------|
| Peninsular Malaysia | 5.915  | 5.830  | 5.864  | 5.807  | 5.789  | 5.831  |
| Sabah               | 4.420  | 4.360  | 4.436  | 4.436  | 4.430  | 4.430  |
| Sarawak             | 7.861  | 7.624  | 7.627  | 7.688  | 7.795  | 7.795  |
| Total               | 18.196 | 17.814 | 17.927 | 17.931 | 18.014 | 18.056 |

#### Table 1.1 Total Forested Areas (million ha)

Source: Ministry of Natural Resources and Environment

#### 1.5 Biodiversity

Malaysia is considered one of the world's megadiverse countries with an estimated 15,000 species of vascular plants, 306 species of wild mammals, more than 742 species of birds, 567 species of reptiles, 242 species of amphibians, approximately 1,619 species of marine fish, more than 449 species of freshwater fish, 612 species of coral and over 150,000 species of invertebrates<sup>1</sup>. Malaysia's terrestrial biodiversity is concentrated within its tropical rainforests that extend from coastal plains to mountain areas, including inland waters such as lakes and rivers. Marine biodiversity is found among islands and coastal ecosystems, especially in coral reefs and sea grasses. Agricultural biodiversity is supported in plantations, rice fields, fruit orchards, and farms. Table 1.2 presents the general overview of ecosystems in Malaysia.

#### Table 1.2 Overview of Ecosystems

| Thematic Area                      | Ecosystem   |  |  |  |
|------------------------------------|---|--|--|--|
| Forest Biodiversity                | Lowland evergreen forest  |  |  |  |
|                                    | Lowland dipterocarp forest  |  |  |  |
|                                    | Heath forest  |  |  |  |
|                                    | Limestone forest  |  |  |  |
|                                    | Mixed dipterocarp forest  |  |  |  |
|                                    | Hill dipterocarp forest   |  |  |  |
|                                    | Hill mixed dipterocarp forest   |  |  |  |
| Mountain Biodiversity              | Montane forest  |  |  |  |
|                                    | Subalpine forest  |  |  |  |
| Inland Waters<br>Biodiversity      | <ul> <li>Peat swamp forest</li> <li>Freshwater swamp forest</li> <li>Riparian forest</li> <li>Rivers, ponds, lakes, etc.</li> </ul>                 |  |  |  |
| Marine and Coastal<br>Biodiversity | <ul> <li>Coastal hill dipterocarp forest</li> <li>Mangrove forests</li> <li>Mudflats</li> <li>Coral reef</li> <li>Sea grass</li> </ul>              |  |  |  |
| Agricultural<br>Biodiversity       | <ul> <li>Plantations</li> <li>Rice fields</li> <li>Fruit orchards &amp; vegetable farms</li> <li>Livestock rearing and aquaculture farms</li> </ul> |  |  |  |

The Federal Government has been increasing its efforts in synergising forest and biodiversity conservation. The increased awareness of the concept of High Conservation Value Forests (HCVF) has led to its inclusion as an important criterion in the assessment of PRFs in relation to Sustainable Forest Management compliance standards. The identification, sound management and protection of HCVF results in in-situ conservation of various unique flora species, water catchment areas, seed production areas, pristine virgin jungle reserves, lowland dipterocarp forest and customary burial grounds.

In Peninsular Malaysia, a central forest runs the length of the peninsula, straddling eight states and comprises four main forest complexes. To synergise forest and biodiversity conservation and enhance ecosystem services, the Central Forest Spine (CFS) Master Plan was adopted by the Government in 2011. The plan aims to restore connectivity of forest complexes within the CFS that forms the backbone of networks of environmentally sensitive areas in Peninsular Malaysia. A total of 17 primary forested linkages are proposed. The CFS Master Plan is institutionalised in Malaysia's National Physical Plan 2 (2010), which provides the backdrop of national strategic spatial planning policies and measures in terms of general direction as well as broad land use and physical development and conservation in Peninsular Malaysia up till the year 2020.

The Heart of Borneo (HoB) Initiative was declared in 2007 by the Governments of Brunei, Indonesia and Malaysia as a transboundary collaboration to enable conservation and sustainable development that improves the welfare of those living on the island, while minimising deforestation, forest degradation and the associated loss of biodiversity and ecosystem services. This governmentled initiative, in collaboration with nongovernmental organisations (NGOs), seeks to ecologically connect approximately 200,000 km<sup>2</sup> forests in Borneo. Approximately 60,000

<sup>1</sup> Fifth National Report (of Malaysia) to the Convention on Biological Diversity

km<sup>2</sup> are represented by the Malaysian States of Sabah and Sarawak.

#### 1.6 Water Resources

Malaysia depends on its abundant annual rainfall for its main water resources. The National Water Resources Study (2000-2050) reported that the country receives about 973 billion cubic metres of water from rainfall annually. From this, total surface runoff is estimated to be 496 billion cubic metres per year. About 414 billion cubic metres would return to the atmosphere annually through evapotranspiration and 63 billion cubic metres as groundwater recharge. Rainfall is unevenly distributed with some States having more rain than others. High intensity and/or long duration rainfalls will result in flooding in low-lying and coastal areas where rivers are short and catchment areas are small. Smaller catchment areas may also expose certain regions to water stress and droughts.

Considering that surface water, i.e. from rivers and reservoirs, provides about 97% of the nation's water demands, the management of forests as water catchment areas is vital in ensuring a sustainable source of water. Due to increasing population and sustained economic growth, demand for water is expected to increase. The Tenth Malaysia Plan (2011-2015), which is the main five-year socio-economic development plan for the country, stressed the need for a water resources policy that charts the future course for the water sector in Malaysia. Endorsed by the Cabinet in 2012, the National Water Resources Policy (NWRP) for Malaysia is intended to act strategically towards ensuring that the demand for water by all user sectors is met in terms of quantity and quality for both

man and nature. It provides clear directions and strategies in water resources management to ensure water security as well as sustainability. Its four focus areas are water resources security, water resources sustainability, partnership, and capacity building and awareness.

#### 1.7 Population

#### 1.7.1 Population and Population Density

The total population of Malaysia in 2011 was 29.1 million (Table 1.3). Population increased approximately 24.9% over the period 2000-2011. There is gradual increase of population density of Malaysia from 71 per km<sup>2</sup> in year 2000 to 88 per km<sup>2</sup> in 2011.

#### 1.7.2 Urbanisation Rate

The urbanisation rate of Malaysia increased from 62.0% in 2000 to 71.0% in 2010. The rate varied from state to state. Table 1.4 presents the urbanisation rates of the states in Malaysia from 2000 to 2010.

#### 1.7.3 Age Distribution

In 2011, approximately 26.9% of the population was under 15 years old, 68.0% was from between ages 15-64, and only 5.1% was over 65 years of age (Table 1.5). In 2012, there was a slight decline of population under 15 years old to 26.4%. This was offset by increase in the age group 15 to 64, and 65 and above, to 68.3%, and 5.3% respectively.

#### 1.7.4 Life Expectancy

The average life expectancy at birth continues in an upward trend, reaching 74.32 years in 2011 compared to 72.2 years in 2000 (Table 1.6). Compared to year 2000, female and

male life expectancies at birth increased by about 2.25 years and 2.16 years respectively. Female life expectancy increased from 74.65 years in 2000 to 76.90 years in 2011. Male life expectancy increased from 70.0 years in 2000 to 72.16 years in 2011.

#### 1.7.5 Public Health

Health and well-being are part of the improved standard of living and quality of life that the nation aspires to achieve. Within the Tenth Malaysia Plan (2011-2015), the Government of Malaysia is reforming the healthcare delivery system, focussing on the following four key areas:

- Transforming delivery of the healthcare system;
- Increasing quality, capacity and coverage of the healthcare infrastructure;
- Shifting towards wellness and disease prevention, rather than treatment; and
- Increasing the quality of human resource for health.

As the lead agency, the Ministry of Health (MOH) is the main provider of healthcare services. An extensive network of primary

healthcare services is delivered by Government health facilities together with private medical and dental clinics. This network is supported by secondary and tertiary services provided by the Government and private sector. Table 1.7 presents a summary of the health care facilities in 2008 and 2011.

#### 1.8 Economy

## 1.8.1 Economic Transformation Programme

Malaysia launched the Economic Transformation Programme (ETP) in September 2010 as part of its National Transformation Programme. The ETP represents the catalyst for economic growth and investments. Twelve National Key Economic Areas (NKEAs) representing economic sectors which account for significant contributions to Gross National Income (GNI) were identified for implementation until 2020. The 12 NKEAs are Oil, Gas and Energy; Palm Oil & Rubber; Financial Services; Tourism; Business Services; Electronics & Electrical; Wholesale & Retail; Education; Healthcare; Communications Content and Infrastructure; Agriculture; and Greater Kuala Lumpur/Klang Valley. Each NKEA comprises Entry Point Projects (EPPs), which explore new growth areas, and business opportunities hence enabling the sectors to move further up the value chain. Identified are 154 EPPs across the 12 NKEAs. The Government facilitates the

ETP by coordinating, tracking and monitoring the programme. While the Government will prioritise its policies and spending for the ETP, the bulk of investments are to be financed by the private sector.

The programme aims to raise Malaysia's competitiveness through the implementation of six Strategic Reform Initiatives (SRIs). The main thrust of the SRIs is to create an efficient, competitive and business-friendly environment in Malaysia that will allow world-class, local champions to thrive and attract valuable foreign investment. The SRIs comprise policies which strengthen the country's commercial environment to ensure Malaysian companies are globally competitive. The six SRIs are Competition, Standards & Liberalization; Public Finance Reform; Public Service Delivery; Narrowing Disparities; Government's Role in Business; and Human Capital Development.

2005 to 2013, except for 2009. The compound average growth rate for GDP at constant prices from 2005 to 2011 was approximately 4.6%. GDP per capita grew from RM20,870 in year 2005 to RM24,492 in year 2011. Table 1.8 shows key data on GDP and GNI.

The main contributions to GDP in 2005 and 2011 were the services sector, manufacturing sector and mining and quarrying as presented in Figures 1.4 and 1.5 respectively.

Within the services sector for the year 2011, the retail trade, accommodation and restaurants subsector contributed 17%, the finance, insurance, real estate and business service subsector contributed about 15%, the wholesale, and the transport, storage and communications subsector contributed 7%. The remaining sub-sectors are government services (8%); electricity and utilities (3%) and other services (5%).

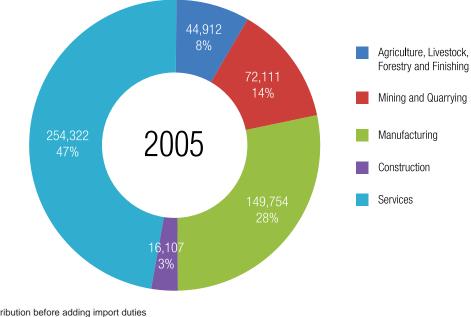

## 1.8.2 Gross Domestic Product

The Gross Domestic Product (GDP) of Malaysia has shown a continual upward trend from

| Year    | Gross Dom         | estic Product                      | Gross National Income |                                    | Gross Domestic<br>Product<br>per capita | Gross National<br>Income<br>per capita |

#### 1.8.3 Unemployment

The unemployment rate of Malaysia during the period 2000-2013 was 3.0% and above (Table 1.9). It peaked at 3.7% in 2009. In 2011, the unemployment rate was 3.1%.

#### **Table 1.9 Unemployment Rates**

| Year | Unemployment Rate (%) |
|------|-----------------------|
| 2000 | 3.0                   |
| 2005 | 3.5                   |

## 1.9 Energy Sector

## 1.9.1 Energy Security

In tandem with population and economic growth energy demand is expected to grow. Hence, there is a need to ensure reliable and affordable energy for the economy, while at the same time limiting negative impacts on the environment and safeguarding long-term energy security. Malaysia's energy policy is guided by three principle objectives stated in the National Energy Policy (1979):

- Supply Objective to ensure adequate, secure and cost-effective energy supply through developing and utilising alternative sources of energy, both non-renewable and renewable, from within and outside the country;
- Utilization Objective to promote efficient utilisation of energy and discourage

wasteful and non-productive patterns of energy consumption;

• Environmental Objective - to minimise the negative environmental impacts on the energy supply chain, i.e. energy production, conservation, transportation and utilisation.

Efforts to ensure greater energy security, reduce dependency on petroleum products and environmental considerations are major objectives of subsequent energy policies such as the National Depletion Policy (1980), Four Fuel Diversification Policy (1981), Five Fuel Policy (2001) and National Biofuel Policy (2006).

## 1.9.2 Energy Balance

Malaysia's primary energy supply in 2000 was 50,710 ktoe (Figure 1.6 and Table 1.10). This increased to 66,211 ktoe in 2005 and 79,289 ktoe in 2011. The main source of primary energy supply of Malaysia comes from oil and gas. In terms of total share for year 2011, natural gas was highest at 45% (reduced from 51% in year 2005) followed by crude oil and petroleum products at 34% (reduced from 36% in 2005). The contributions from oil and gas declined from a combined 87% in year 2005 to 79% in year 2011. The share of coal and coke represented 19% (increased from 11% in 2005), while hydropower was maintained at 2% (similar to year 2005).

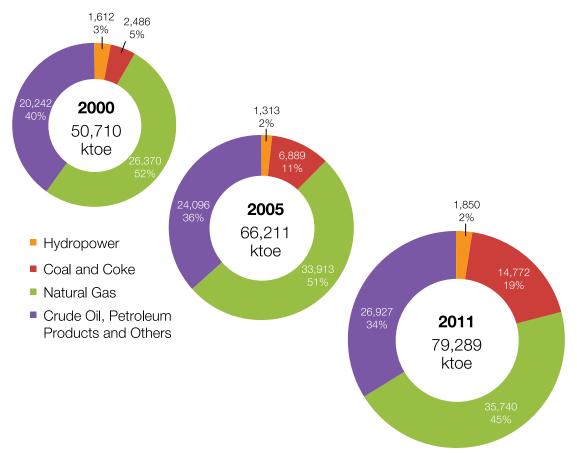

Final energy consumption was 29,699 ktoe in 2000. By 2005 this increased to 38,284 ktoe and by 2011, final energy consumption was 43,456

| Year                                     | 2000   | 2005   | 2010   | 2011   | 2012   | 2013   |
|--|--------|--------|--------|--------|--------|--------|
| Hydropower                               | 1,612  | 1,313  | 1,577  | 1,850  | 2,150  | 2,688  |
| Coal and Coke                            | 2,486  | 6,889  | 14,777 | 14,772 | 15,882 | 15,067 |
| Natural Gas                              | 26,370 | 33,913 | 35,447 | 35,740 | 38,647 | 39,973 |
| Crude Oil, Petroleum Products and Others | 20,242 | 24,096 | 25,008 | 26,927 | 29,815 | 33,003 |
| Total                                    | 50,710 | 66,211 | 76,809 | 79,289 | 86,494 | 90,731 |

#### Table 1.10 Primary Energy Supply (ktoe)

Source: Ministry of Energy, Green Technology and Water (2013), National Energy Balance 2012.

ktoe. Table 1.11 shows the trend of final energy consumption by sector. All sectors exhibited growth in energy consumption. In 2011 energy demand was highest for the transport sector at 39.3%, followed by the industrial sector at 27.8%. These were followed by residential and commercial demand at 16.1%, the non-energy sector at 14.7% and the agriculture sector at 2.1%. GDP has remained coupled to primary energy supply as shown in Figure 1.7. With increasing wealth, final energy consumption per capita increased from 1.26 toe per capita in the year 2000 to 1.50 and 1.72 toe per capita in 2011 and 2013 respectively. Electricity consumption per capita rose from 2,603 kWh in 2000 to 3,706 kWh and 4,110 kWh in 2011 and 2013 respectively (Figure 1.8).

| Year                     | 2000   | 2005   | 2010   | 2011   | 2012   | 2013   |
|--------------------------|--------|--------|--------|--------|--------|--------|
| Agriculture              | 104    | 101    | 1,074  | 916    | 1,053  | 1,051  |
| Non-Energy               | 2,250  | 2,173  | 3,696  | 6,377  | 7,497  | 7,277  |

## 1.9.3 Renewable Energy

The promotion of renewable energy (RE) is addressed by the National Renewable Energy Policy and Action Plan, approved by the Cabinet in 2010, with the vision of "enhancing the utilisation of indigenous renewable energy resources to contribute towards national electricity supply security and sustainable socio-economic development". The adoption of RE technology is also supported by the National Green Technology Policy (2009) aimed at providing a conducive environment for the development of green technology to become one of the economic drivers in the country. It is centred around the four primary pillars of energy, environment, economy, and social perspective.

The Renewable Energy Act 2011 provided for the establishment and implementation of a Feed-in Tariff (FiT) scheme to catalyse the generation of electricity from renewable energy sources. This scheme offers long-term agreements to renewable energy producers to sell electricity to the grid at premium prices. Furthermore companies generating energy from renewable sources have a choice of applying for incentives, such as pioneer status with income tax exemption; or investment tax allowance on qualifying capital expenditure incurred. Other incentives include import duty and sales tax exemption on equipment used to generate energy from renewable sources. The Sustainable Energy Development Authority of Malaysia (SEDA Malaysia), formed under the Sustainable Energy Development Authority Act 2011, has the key responsibility to administer and manage the implementation of the FiT mechanism. From December 2011, an additional 1% on the monthly electricity bill exceeding 300kWh was collected and deposited into the Renewable Energy Fund to finance the implementation of the FiT mechanism. The rate had been increased to 1.6% in January 2014.

As of 2013, the cumulative grid-connected installed capacity of RE since the inception of FiT reached 147.9 MW (Table 1.12).

Table 1.13 shows the amount of RE generated under the FiT system on an annual basis. Compared with 2012, the annual power generation of commissioned RE installations more than tripled in 2013.

## 1.10 Other Sectors

#### 1.10.1 Transport

The Land Public Transport Commission (SPAD) was established in 2010 with the mission to ensure "a safe, reliable, responsive, accessible, planned, integrated, affordable, and sustainable land and public transport system to enhance economic growth and quality of life". SPAD's main role includes

| Year  | Biogas | Biomass | Small Hydro | Solar PV | Total  |

policies, planning and regulation of all aspects of train, bus and taxi services as well as road and rail-based freight transport. It is expected to work closely with other planning authorities such as the Department of Town and Country Planning and local councils to ensure that the development of public transport is in line with land-use development.

There is a continual trend in the increase in the length of roads, motor-vehicle registration and use of public transportation. The public transport modes consist of buses, trains and taxis. In particular there is a growth in passenger ridership on the light rail transit (LRT) and commuter trains in the Klang Valley, where the capital city of Kuala Lumpur is situated.

## 1.10.1.1 Roads

In 2011, the total length of roads in Malaysia was approximately 155,427 km. The total length of roads increased by 133% from 2000 to 2011. Table 1.14 shows the breakdown of roads into state roads and federal roads.

#### Table 1.14 Lengths of Roads (km)

| Year | State<br>Roads | Federal<br>Roads | Total   |
|------|----------------|------------------|---------|
| 2000 | 50,814         | 15,631           | 66,445  |
| 2005 | 70,749         | 16,276           | 87,025  |
| 2010 | 127,149        | 17,254           | 144,403 |
| 2011 | 137,952        | 17,475           | 155,427 |
| 2012 | 163,272        | 17,610           | 180,882 |

#### Table 1.15 Motor-Vehicle Registration

#### 1.10.1.2 Motor-vehicle Registration

There is an increasing trend in motor-vehicle registration for all categories of vehicles (Table 1.15). There were 21.4 million registered vehicles in 2011. The majority of vehicles registered were motorcars and motorcycles representing 45.4% and 46.7% respectively.

## 1.10.1.3 Urban Rail Transit

Rail services have become a significant public transport in Kuala Lumpur and its suburbs. Based on ridership numbers, rail travel is the most used public land transport option and will continue to play an important and integral role in public transport in the Klang Valley. There are four urban rail network lines running though the Klang Valley – LRT AMPANG LINE (previously known as STARLINE), LRT KELANA JAYA LINE (previously known as PUTRALINE), KL Monorail and KTM Komuter. In addition, the EXPRESS RAIL LINK SDN BHD provides highspeed airport rail-link service between Kuala Lumpur Sentral (KL Sentral) and the Kuala Lumpur International Airport (KLIA). The LRT AMPANG LINE is a 27 km light rail transit line and it commenced operation on 16 December 1996. The second light rail transit line is the 29 km LRT KELANA JAYA LINE which commenced operation on 1 September 1998. The 8.6 km KL Monorail started operations on 31 August 2003. The KTM Komuter is a 175 km meter gauge network consisting of two cross-city routes and

a shuttle service. Table 1.16 below presents ridership of all these urban rail transits.

The LRT KELANA JAYA LINE is being extended another 17.4 km while the LRT AMPANG LINE is being extended an additional 18.1 km, the extensions being expected to be completed by 2016.

#### 1.10.1.4 Inter-city Railway Statistics

Malaysia has approximately 1,800 km of intercity/inter-state railway tracks. This consists of 1,641 km of meter gauge railway in Peninsular Malaysia and 134 km of railway in Sabah. The Electric Train Service (ETS) provides intercity train service, connecting Kuala Lumpur and Ipoh. The table below shows the railway statistics up to year 2013 for Peninsular Malaysia.

## 1.10.1.5 Air Traffic Statistics

Between 2000 and 2013 there has been a general increase of air traffic passengers for both domestic and international air travel (Table 1.18). The total number of embarked and disembarked domestic passengers increased from 19.1 million in 2000 to over 34.2 million in 2011 and 42.9 million in 2013. The number of embarked and disembarked international passengers increased from 12.5 million in 2000 to 30.4 million in 2011 and 38 million on 2013. From 2000 to 2013 the domestic passengers increased by 2.24 times and the international passengers by 3.03 times showing increasing trends of air travel.

Air cargo also showed an increase from 2000 to

2013 with domestic cargo increasing by about 1.47 times and international cargo increasing by 1.12 times over the period (Table 1.19).

## 1.10.2 Agriculture

The National Agro-food Policy was adopted in 2011, replacing the Third National Agriculture Policy. The objectives of the National Agro-food Policy, 2011-2020 are to: (i) ensure adequate food supply and food safety; (ii) develop the agro-food industry into a competitive and sustainable industry; and (iii) increase the income level of agricultural entrepreneurs. Sustainable agriculture development is one of the key thrusts under the policy in which the importance of the environment and biodiversity are addressed.

#### 1.10.2.1 Agricultural Crops

Oil palm and rubber are the two most important agricultural crops for the country, providing income and employment - upstream and downstream. In ensuring that the growths of these crops are aligned with the sustainable development goals of the country, practices such as utilisation and optimisation of idle agriculture land are implemented and product certification is introduced. Comparing year 2011 with year 2000, there has been a decline in the land area planted with rubber and cocoa; however, the land area planted with oil palm has increased by 1.48 times. Table 1.20 shows the planted areas of major agricultural crops.

Chapter 9 of the NKEA addressed the need for expansion of both upstream and downstream

#### Table 1.20 Planted Areas of Major Agricultural Crops ('000 ha)

| Year<br>Crop | 2000      | 2005     | 2010     | 2011     | 2012     | 2013     |

activities of the palm oil sector. As of 2011, about five million ha are planted with oil palm in Malaysia and the report suggests that the potential arable land for oil palm cultivation is limited and the maximum expansion potential is estimated at one million ha, thus capping the cultivated area of oil palm in Malaysia to six million ha. The NKEA focusses on increasing the national average productivity.

## 1.10.2.2 Livestock

Upward trends in livestock were noted for goats and poultry. Goats population doubled in 2011 compared with 2000 and poultry increased by 1.86 times over the same period. Table 1.22 shows selected livestock population.

#### 1.10.2.3 Fisheries

Landings of marine fish (including shellfish collection) were 1.373 million tonnes in 2011,

compared with 1.286 million tonnes in 2000 (Table 1.22).

Aquaculture production in Malaysia increased from 168,000 tonnes in 2000 to 526,000 tonnes in 2011 (Table 1.23). Fresh water aquaculture activities carried out in ponds, ex-mining pools, cages, cement tanks as well as pen cultures contributed 122,000 tonnes, while brackish water marine aquaculture cultivated in ponds, cages and water tanks contributed 404,000 tonnes.

#### 1.10.3 Solid Waste

A developing and growing population is expected to generate an increasing amount of solid waste. Unless solid waste management is effective and efficient, there will be negative impacts on the environment and the health of local community. To enhance solid waste

management, Malaysia has taken a stepwise approach to privatise and centralise its solid waste management.

For States that accept the implementation of the Solid Waste and Public Cleansing Management Act 2007 (Act 672), the solid waste is managed by the Department of National Solid Waste Management and Solid Waste and Public Cleansing Management Corporation. This Act only applies to Peninsular Malaysia and the Federal Territories of Putrajaya and Labuan. In 2011 the Act was enforced in six of the states in Peninsular Malaysia and the Federal Territories. For the States of Selangor, Perak, Pulau Pinang, Kelantan, Terengganu, Sabah and Sarawak, solid waste management is under the jurisdiction of the respective city/ municipal/district councils based on the Local Government Ordinance.

Table 1.24 shows the breakdown of daily waste generation for years 2007 and 2012 for Peninsular Malaysia, Sabah and Sarawak. For year 2012, the overall waste generation for Malaysia was approximately 33,130 tonnes per day, or an average of 1.17 kg/capita/day compared with 0.87 kg/capita/day in 2007. The average per capita waste generation ranges from 1 to 1.33 kg per person per day across the strata and housing type. Population distribution and the level of development dictate the distribution of waste disposal sites and waste characteristics in the country. More waste is generated in areas where developments are highest.

#### Table 1.24 Average Waste Generations per Day in 2007 and 2012

| Year<br>Region                         | 2007*  | 2012** |
|--|--------|--------|
| Peninsular<br>Malaysia<br>(tonnes/day) | 20,500 | 27,802 |
| Sabah (tonnes/<br>day)                 | 1,210  | 2,984  |
| Sarawak<br>(tonnes/day)                | 1,988  | 2,344  |

\* Reported in NC2

\*\* Survey on Solid Waste Composition, Characteristics & Existing Practice of Solid Waste Recycling in Malaysia (Internal Report of the National Solid Waste Management Department, 2014) There were 165 operational landfills and 131 closed landfills in Malaysia in 2011-2013. Among these were eight sanitary landfills and three inert landfills. Ninety-six of the operational landfills and 115 of the closed landfills were located in Peninsular Malaysia. Based on the estimates made for year 2012, the overall waste generation in Peninsular Malaysia (combining household, institutional, commercial and industry) is about 27,802 tonnes per day. Per capita waste generation ranges from 1.10 to 1.35 kg/capita/day, with an average of 1.23 kg/capita/day. Klang Valley residents produce more waste, 1.35 kg/capita/day than the other regions whereas the East Coast has the lowest waste generation rate at 0.95 kg/capita/day.

For Sarawak there were 49 landfills in 2011-2013 and 45 of these landfills were categorised as open dumpsites and four were categorised as sanitary landfills. There were also 19 closed dumpsites spread out over the State of Sarawak in 2013. In 2012, the average daily waste collected in Sarawak was 2,344 tonnes or average of 0.95 kg/capita/day.

For Sabah, there were 19 operational landfills and two closed landfills spread out over the State in 2011- 2013. In 2012, the average waste collected in Sabah was 2,984 tonnes or 0.91 kg/capita/day.

Table 1.25 shows the estimation of solid waste composition for the whole of Malaysia based

#### Table 1.25 Solid Waste Composition

| Composition  | 2005*   | 2012**  |
|--------------|---------|---------|

Sources: \* EPU (2006) *Ninth Malaysia Plan 2006-2010* \*\* Survey on Solid Waste Composition, Characteristics and Existing Practice of Solid Waste Recycling in Malaysia (Internal Report of the National Solid Waste Management Department, 2014) on the Survey on Solid Waste Composition, Characteristics and Existing Practice of Solid Waste Recycling carried out by the National Solid Waste Management Department for the year 2012. Food residue remains the biggest proportion of the waste at 45%. Plastics had decreased from 24% of waste in 2005 to 13.2% in 2012. However, paper waste has increased from 7% of the waste in 2005 to 8.5% in 2012. In 2012, under the category "Others", disposable diapers and disposable feminine sanitary products formed 12.1% of the waste.

## 1.11 Institutional Arrangement

## 1.11.1 National Green Technology and Climate Change Council

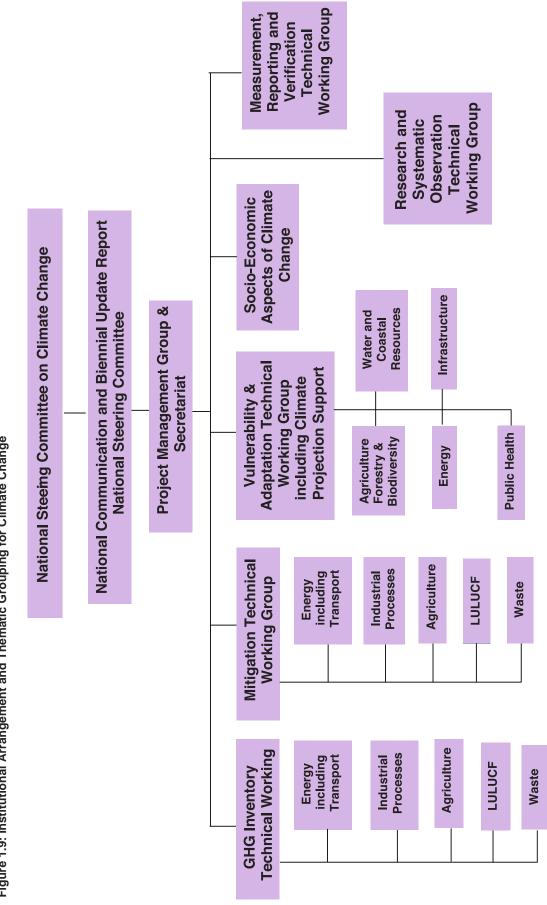

The National Green Technology and Climate Change Council was established in September 2009 to formulate policies and identify strategic issues to implement in the National Green Technology Policy and the National Policy on Climate Change. It is chaired by the Prime Minister and comprises a number of key Cabinet Ministers as members making it an ideal platform for high-level decision-making on climate change.

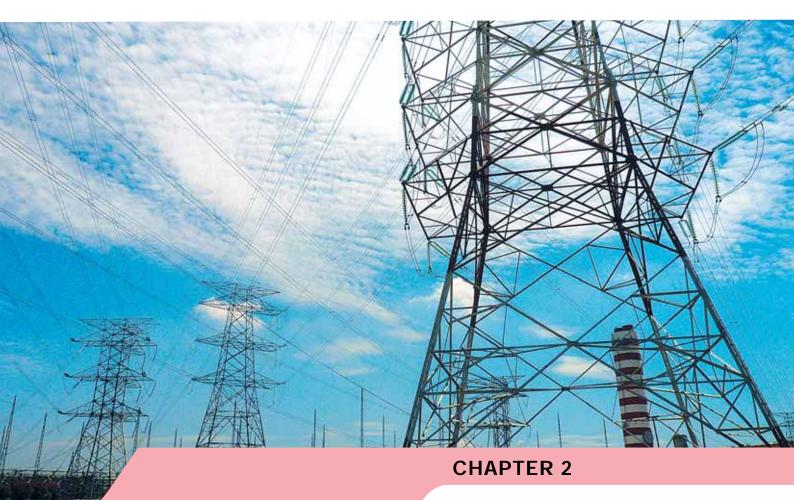

## 1.11.2 National Steering Committee on Climate Change

Operational matters on climate change are guided and endorsed by the National Steering Committee on Climate Change (NSCCC) chaired by the Secretary General of the Ministry of Natural Resources and Environment (NRE). Its membership includes representatives from ministries, agencies, the private sector and non-government organisations. The coordination for the preparation of national communications (NCs) and biennial update reports (BURs) is under the National Communication and Biennial Update Report National Steering Committee (NCBURNSC) which reports to the NSCCC. The secretariat to this Steering Committee is the Environmental Management and Climate Change Division of NRE, which is also the national focal point for climate change to the UNFCCC. The technical work of the NCs and BURs is carried out through five Technical Working Groups (TWG) established under the NCBURNSC. Figure 1.9 shows the institutional arrangement and thematic groupings to address climate change and NC/BUR reporting.

## 1.11.3 National Steering Committee and Technical Working Committee for REDD+

At the national level, the National Steering Committee on REDD+ (NSCREDD) was established in 2011 to formulate directions and strategies for REDD+ implementation. The NSCREDD is chaired by the Secretary General of NRE, with membership from State Economic Planning Units, Forestry Departments and relevant Federal Ministries. NSCREDD is supported by a Technical Committee on REDD+, chaired by the Deputy Secretary General (Environment) of NRE. The roles of this Technical Committee include providing methodological guidance on REDD+ implementation and formulating national action plans.

NATIONAL GREENHOUSE GAS INVENTORY

# CHAPTER 2: NATIONAL GREENHOUSE GAS INVENTORY

## 2.1 Methodology for Greenhouse Gas Emissions Calculation

The Greenhouse Gas (GHG) inventory described in this chapter details the national anthropogenic emissions and removals for the year 2011. Estimations were carried out for five sectors, namely the energy; industrial processes; agriculture; land use, land-use change and forestry (LULUCF); and waste sectors. The inventory also contains time series estimates from (i) 1990 to 2011 for the energy, agriculture and LULUCF sectors; (ii) 1991 to 2011 for the waste sector; and (iii) 2000 to 2011 for the industrial processes sector.

In line with Decision 17/CP.8 and Annex III of Decision 2/CP.17 of UNFCCC, the *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories* were used to estimate GHG emissions. The *Good Practice Guidance for Land Use, Land-Use Change and Forestry* was used to estimate emissions and removals for the LULUCF sector. In addition, the *Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories* was applied to improve the transparency, accuracy, consistency, comparability and completeness of the inventory. The time series were recalculated to reflect updated activity data in accordance with these guidelines. Emission estimates were based on the sectoral approach for the energy sector. Estimates were made using the default conversion and emission factors provided in the *Revised 1996 IPCC Guidelines* for the energy, agriculture and waste sectors. For the LULUCF and industrial processes sectors, country-specific emission factors were applied in some subsectors. However, the emissions from iron and steel production were estimated using emission factors from the *2006 IPCC Guidelines for National Greenhouse Gas Inventories.* 

The estimated methane (CH,), nitrous oxide (N<sub>2</sub>O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulphur hexafluoride (SF<sub>4</sub>) emissions were converted to carbon dioxide equivalents (CO<sub>2</sub>eq) using the global warming potential (GWP) values reported in the IPCC Second Assessment Report (AR2). Data sources and assumptions for generation of activity data required for the estimation for each sector are contained in Technical Annex 1.

## 2.2 Improvements in Current Greenhouse Gas Inventory Preparation

A broader base of stakeholders was engaged either directly or indirectly throughout the preparation of the inventory. The key categories included in this inventory as compared with the INC and NC2 are shown in Table 2.1. Improvements in terms of coverage, activity data and emission factors

as well as changes in technologies and practices were also considered. Energy sector activity data for domestic and international aviation have been disaggregated. Industrial processes sector emissions from aluminium

Note:

NO (not occurring) - activities or processes that do not occur for a particular gas or source/sink category within a country;

NE (not estimated) - existing emissions and removals which have not been estimated;

NA (not applicable) - for activities in a given source/sink category which do not result in emissions or removals of a specific gas.

<sup>4</sup> Sectoral Approach: estimation of CO<sub>2</sub> from fuel consumption by sector or "bottom-up" approach.
 <sup>5</sup> Reference Approach: estimation of total CO<sub>2</sub> from total fuel supplied to the country or "top-down" approach.

production have been included (whereas nitric acid production ceased in 2009). For the agriculture sector, activity data on crop residues have been included for estimation of emissions from agricultural soils. Emissions of  $N_2O$  from domestic wastewater handling are now included in the waste sector emissions. Emissions and removals from cocoa cultivation are included for the LULUCF sector.

## 2.3 Summary of Greenhouse Gas Emissions and Removals for 2011

## 2.3.1 Major Sources of Greenhouse Gas Emissions

Malaysia's GHG emission was 290,230 Gg  $CO_2$ eq in 2011 and removal was 262,946 Gg

 $CO_2$ eq. The net emission after accounting for removal was 27,284 Gg  $CO_2$ eq (Table 2.2).

Emissions in the energy sector increased by 48%, industrial processes sector by 46%, agriculture sector by 35%, waste sector by 45% and LULUCF net removals increased by 14% between the years 2000 and 2011 (Figure 2.1).

Over the same period,  $CO_2$  emissions including LULUCF emissions only, increased by 31%,  $CH_4$  emissions by 37% and  $N_2O$  by 44% (Figure 2.2). In the comparison the recalculated values for the year 2000 were used.

For the year 2011, the energy sector was the highest contributor to GHG emissions at 76%,

| Sector  | Gas                           | Emissions (Gg)<br>A | GWPs<br>B | CO <sub>2</sub> Equivalent (Gg)<br>C=(A x B) |  |

Note: Negative values indicates sink.

followed by the waste sector at 12%, industrial processes at 6%, agriculture sector at 5% and LULUCF at 1%. For the GHG inventory for the years 2000 and 2005, the energy sector contributed 68% and 71% respectively (Figure 2.3).

 $CO_2$  emissions amounted to 73%, 76% and 72% of the total GHG emissions in 2000, 2005 and 2011 respectively (Figure 2.4). CH<sub>4</sub> emissions were 23%, 20% and 23% respectively for those years. N<sub>2</sub>O emissions increased from 4% to 5% between 2000 and 2011.

#### 2.3.2 Major Sources of Carbon Dioxide Emissions

In 2011, a total of 208,258 Gg  $CO_2$  was emitted. The  $CO_2$  emission from energy industries was the highest at 113,567 Gg  $CO_2$  (55%), followed by emissions from transport at 44,007 Gg  $CO_2$ (21%) (Figure 2.5). Emissions from energy industries were due to the fuels used by the power and auto producers for producing electricity, petroleum refining and natural gas transformation. Manufacturing industries and construction was the third largest contributor to  $CO_2$  emissions at 23,004 Gg  $CO_2$  (11%).

#### 2.3.3 Major Sources of Methane Emissions

For 2011, a total of 67,532 Gg  $CO_2eq$  was emitted (Figure 2.6). The highest emission was from the solid waste disposal sites, which accounted for about 46% of the CH<sub>4</sub> emissions, followed closely by fugitive emissions from oil and natural gas, amounting to 44%.

Figure 2.5: Major Sources of Carbon Dioxide Emissions in 2011

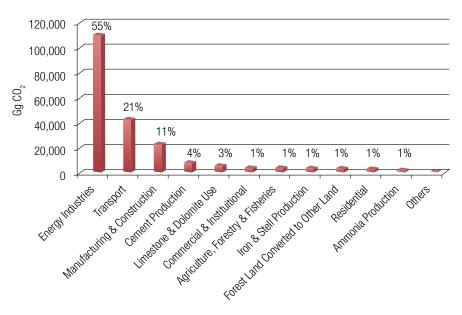

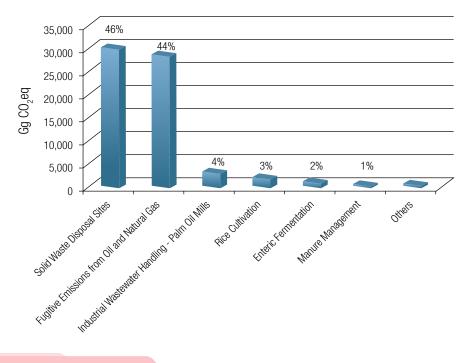

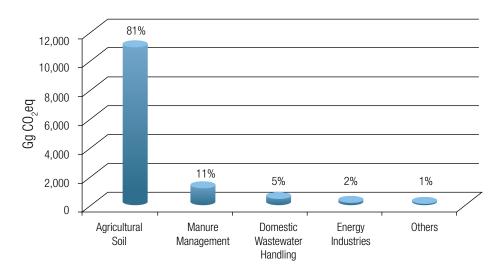

Figure 2.6: Major Sources of Methane Emissions in 2011

#### Figure 2.7: Major Sources of Nitrous Oxide Emissions, in 2011

#### 2.3.4 Major Sources of Nitrous Oxide Emissions

In 2011, a total of 13,574 Gg  $CO_2$ eq of  $N_2O$  were emitted. The emissions were primarily from the agriculture sector as shown in Figure 2.7. Agriculture soils contributed 81% of the emissions.

#### 2.3.5 Carbon Dioxide Removals

CO<sub>2</sub> removals by sinks occurred in the LULUCF sector. Net removal from the LULUCF sector amounted to 260,457 Gg CO<sub>2</sub>eq. Emissions considered in *Forest Land Remaining Forest Land* were carbon loss from commercial harvest, forest fires and emissions from drained peat swamp forest. For *Crop Land Remaining Crop Land*, emissions considered were from total harvest and cultivation in drained peat-lands (Table 2.3).

## 2.4 Key Categories of Emissions and Uncertainty Assessment

#### 2.4.1 Key Category Analysis

The key source of GHG emissions for 2011 are shown in Tables 2.4 and 2.5. Overall, the key categories did not change much between 2000 and 2011. However, emission from LULUCF is ranked last in the key category unlike in 2000.

The inventory in the BUR has further disaggregated the sources of GHG emissions and hence provides more specific sources of emission of GHGs. Without LULUCF, the main bulk of the emissions under the key categories analysis (Table 2.4) are from the energy sector (74.15%), followed by the waste sector (11.85%), the industrial processes sector (5.38%) and the agriculture sector (3.80%).

| Energy                  | Energy industries: Manufacture<br>of solid fuels & other energy<br>industries ( natural gas<br>transformation) | CO <sub>2</sub>  | 22,920.48   | 7.90%                   | 81.35%     |
| Agriculture             | Agricultural soils   | N <sub>2</sub> O | 10,943.82   | 3.77%                   | 85.12%     |
| Industrial<br>Processes | Mineral products: Cement production  | CO <sub>2</sub>  | 7,766.20  | 2.68%                   | 87.80%     |
| Industrial<br>Processes | Limestone and dolomite use   | CO <sup>5</sup>  | 5,152.17  | 1.78%                   | 89.58%     |
| Waste                   | Industrial wastewater: Palm oil mills  | $CH_4$           | 2,960.14  | 1.02%                   | 90.60%     |
| Energy                  | Other sectors: Commercial  | CO <sub>2</sub>  | 2,933.97  | 1.01%                   | 91.61%     |
| Energy                  | Energy industries: Petroleum<br>refining   | CO <sub>2</sub>  | 2,761.16  | 0.95%                   | 92.56%     |
| Energy                  | Other sectors: Agriculture, forestry and fishery   | CO <sub>2</sub>  | 2,732.81  | 0.94%                   | 93.50%     |
| Industrial<br>Processes | Metal industry: Iron and steel industry  | CO <sub>2</sub>  | 2,565.33  | 0.88%                   | 94.38%     |
| LULUCF                  | Forest land converted to other land use  | CO <sub>2</sub>  | 2,489.67  | 0.86%                   | 95.24%     |

With LULUCF emissions, the total percentages of emissions under the key categories (Table 2.5) do not differ very much. These consist of energy sector (73.52%), waste sector (11.75%), industrial processes (5.34%), agriculture sector (3.77%) and LULUCF (0.86%).

For both categories, the two largest key sources of emissions were from the energy sector. They were emissions from public electricity generation, followed by transport. The third largest source was from solid waste disposal. Fugitive emissions from oil and gas operations ranked fourth.

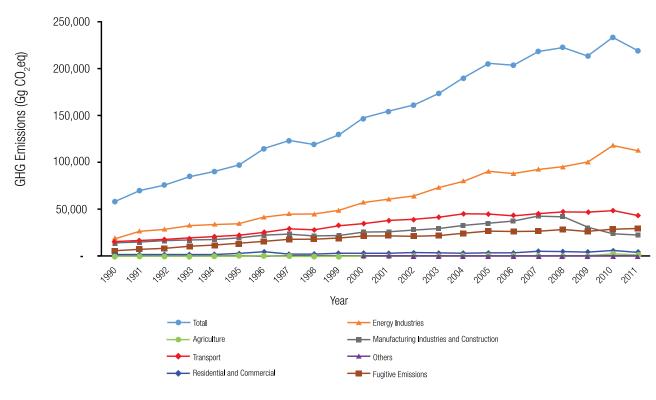

## 2.4.2 Uncertainty Assessment

Uncertainty information is intended to help prioritise efforts to improve the accuracy of the GHG inventory in the future and guide decisions on methodological choices. A tier 1 uncertainty analysis across the sectors was carried out in line with the IPCC Good Practice Guidelines (2000, 2003). The activity data were mainly from nationally published sources, for example the National Energy Balance for the energy sector assessment and the Agrofood Statistics for the agriculture sector assessment. Additional required data were also drawn from international reports, surveys and expert judgement. IPCC default emission factors were used in most sectors. Data from facility level has a 5% uncertainty, published reports between 5-8% uncertainty, while data from surveys has uncertainty in the range between 5-22%. Overall, the uncertainty across the sectors were between 5-20%.

## 2.5 Sectoral Time Series of Emissions

Time series of emissions for the energy, industrial processes, LULUCF, agriculture and waste sectors are shown in Figures 2.8, 2.9, 2.10, 2.11 and 2.12 respectively. Details of the time series values are in Tables E.1 to E.5 of Technical Annex 1.The trend in the energy sector emissions follows the GDP trend of the country. The increasing trend in the waste sector was due mainly to an increase in solid waste generation arising from population growth.

Figure 2.8: Emissions Time Series from 1990 to 2011 for Energy Sector

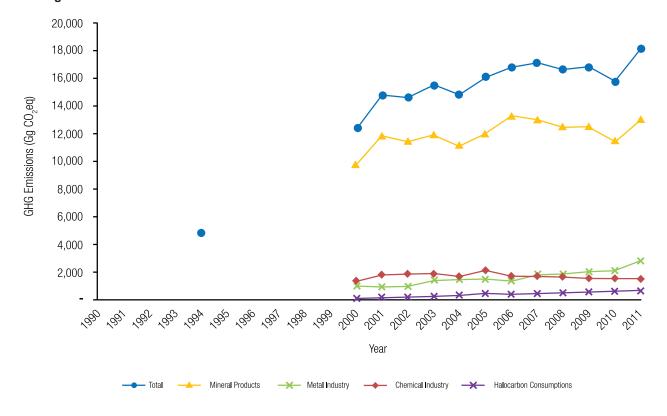

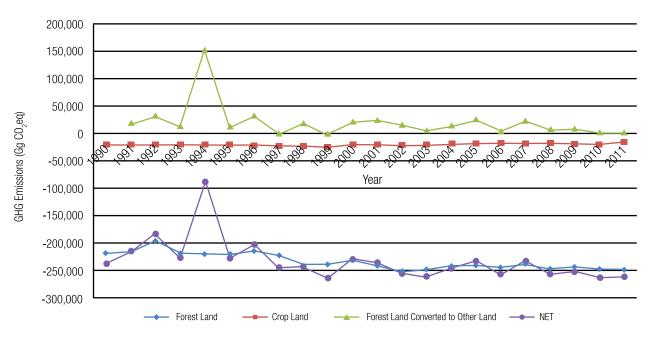

Figure 2.9: Emissions Time Series from 2000 to 2011 for Industrial Processes Sector

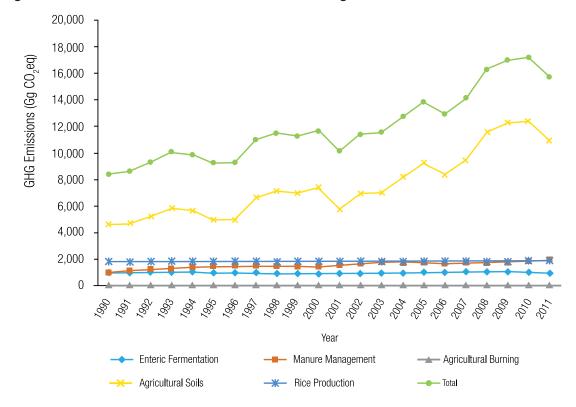

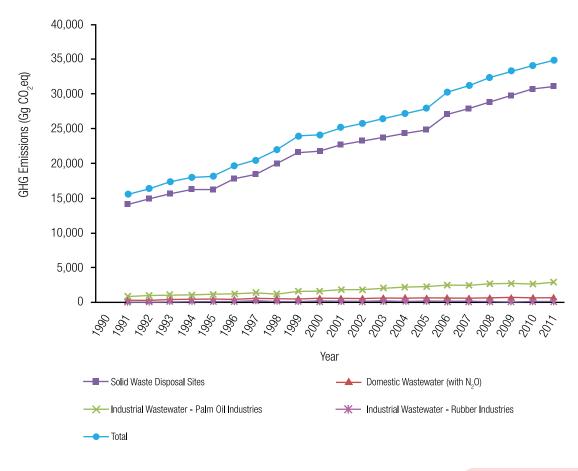

Figure 2.11: Emissions Time Series from 1990 to 2011 for Agriculture Sector

#### 2.5.1 Emissions from Energy Sector

Emissions from the energy industries consistently remained the largest source throughout the time series period. The emissions from this subsector increased from 39.6% in 2000 to 52.0% in 2011. The transport sector was the second largest source comprising 24.3% of the emissions of the energy sector in 2000 and 20.2% in 2011. Emissions from manufacturing industries and construction peaked in 2007 and showed a decreasing trend since then. The emissions from this subsector were 20.1% of the total emissions of the energy sector in 2007 and decreased to 10.6% in 2011.

## 2.5.2 Emissions from Industrial Processes Sector

The mineral products industry was the highest source of emissions for this sector, specifically from cement production and limestone and dolomite use. The contributions of emissions from this subsector to the total emissions of the industrial processes sector were 78.7% in 2000 and 71.9% in 2011.

## 2.5.3 Emissions from Land Use, Land-Use Change and Forestry Sector

Removals and emissions from the LULUCF sector have been stable since 1995. The largest removal was from *Forest Land Remaining Forest Land* and the sole emission was from *Forest Land Converted to Other Land*.

#### 2.5.4 Emissions from Agriculture Sector

For the agriculture sector,  $N_2O$  emissions from agricultural soils were the largest source throughout the whole time series period. The emissions were 63.5% of the total emissions from the agriculture sector in 2000 and 69.4% in 2011.

#### 2.5.5 Emissions from Waste Sector

For the waste sector, methane emissions from solid waste disposal sites remained the largest source throughout the time series period. The emissions were 90.4% of the total emissions of the waste sector in 2000 and 89.2% in 2011. Emissions from wastewater handling in the oil palm industries consistently remained the second largest contributor throughout the time series period.

## 2.6 Greenhouse Gas Emissions for Years 1994, 2000, 2005 and 2011

GHG emissions for 1994, 2000, 2005 and 2011 are shown in Table 2.6. While NC2 reported that Malaysia was a net sink of 26.80 Mt  $CO_2eq$  in 2000, current recalculations show that Malaysia was a net sink of 32.86 Mt  $CO_2eq$  for that year. In 2005 and 2011 Malaysia was a net source of emissions of 30.87 Mt  $CO_2eq$  and 27.29 Mt  $CO_2eq$  respectively. The increase of emissions was due to the significant increase in GHG emissions from the energy sector, while LULUCF's sink capacity has stabilised. The

| Sector                             | Emissions/ Removals (Gg CO <sub>2</sub> eq) |             |             |             |  |  |
|------------------------------------|---|-------------|-------------|-------------|--|--|
| Sector                             | 1994  | 2000        | 2005        | 2011        |  |  |
| Energy                             | 90,890.33                                   | 147,472.09  | 205,100.14  | 218,913.63  |  |  |
| Industrial Processes               | 4,805.41*                                   | 12,416.23   | 16,115.77   | 18,166.34   |  |  |
| Agriculture                        | 9,886.82                                    | 11,699.10   | 13,845.80   | 15,775.30   |  |  |
| LULUCF (Emissions)                 | 153,970.04                                  | 22,359.79   | 25,666.67   | 2,489.67    |  |  |
| Waste                              | 18,005.26                                   | 24,115.89   | 27,934.73   | 34,885.04   |  |  |
| Total emissions                    | 277,557.86                                  | 218,063.10  | 288,663.11  | 290,229.98  |  |  |
| Total sink                         | -241,115.10                                 | -250,927.51 | -257,794.46 | -262,946.41 |  |  |
| Net total (after subtracting sink) | 36,442.76                                   | -32,864.41  | 30,868.65   | 27,283.57   |  |  |

#### Table 2.6 Greenhouse Gas Emissions for the Years 1994, 2000, 2005 and 2011

\*The emissions from Industrial Processes for 1994 only contained cement production

rates of forest conversion have also decreased as indicated by the reduction in emissions from LULUCF.

## 2.7 Greenhouse Gas Emission Intensity Indices

Three approaches are presented in this section (Table 2.7). In the first approach, when LULUCF is excluded, the indices reflect only a modest gain. This is due to the cost differential between carbon-intensive and low-carbon technologies to achieve further emissions reductions. In the second approach, the significant effects of emissions reductions from the LULUCF sector are apparent. The third approach emphasises the impact of forest management and associated GHG removals on the indices.

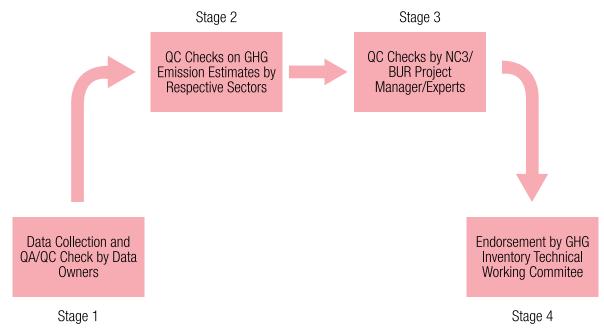

## 2.8 Quality Assurance and Quality Control Arrangement for Greenhouse Gas Inventory

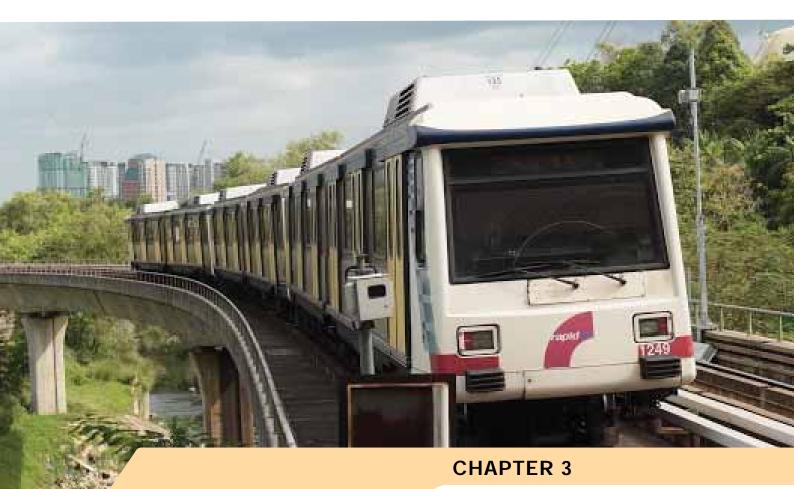

Quality assurance and quality control (QA/ QC) arrangements for the GHG Inventory are shown in Figure 2.13. The sector coordinators were charged with ensuring that adequate QC procedures were performed in the inventory, its supporting documents and spreadsheets. Procedure templates for QA/QC and uncertainty analysis were developed following the USEPA template obtained through the Southeast Asia GHG Inventory Capacity Building Project. The procedures included collecting and reviewing checklists for completeness. The BUR & NC3 Project Manager serves as the QA Manager, ensuring transparency, completeness and accuracy of the GHG inventory. In addition, sectoral experts also reviewed the sectoral reports.

|   | Unit                  | 2000    | 2005    | 2011    | Percentage<br>increase<br>between 2005<br>and 2011 |
|---|-----------------------|---------|---------|---------|--|

#### Table 2.7 Greenhouse Gas Emission Indices for Malaysia

## MITIGATION ACTIONS AND THEIR EFFECTS

# CHAPTER 3: MITIGATION ACTIONS AND THEIR EFFECTS

## 3.1 Introduction

Malaysia has undertaken a number of efforts to address climate change and continually reevaluates its mitigation potential in various key sectors. These actions will contribute towards achieving Malaysia's conditional voluntary indicator to reduce its greenhouse gas emissions intensity of GDP by up to 40% by 2020 as compared with 2005 levels, conditional on receiving technology transfer and finance of adequate and effective levels from developed countries.

This chapter provides an overview of the national policy and planning framework for Malaysia that is relevant to addressing climate change. This is followed by a detailed description of specific mitigation actions for which sufficient quantitative and verifiable data on implementation and effects are available.

## 3.2 National Policy and Planning Framework

## 3.2.1 National Policy on Climate Change

Malaysia's National Policy on Climate Change, approved by the Cabinet in 2009, provides the framework to mobilise and guide Government agencies, industry, communities, as well as other stakeholders in addressing the challenges of climate change in an effective and holistic manner. Its overriding aim is to ensure climate-resilient development to fulfil national aspirations for sustainable development.

The objective of the National Policy on Climate Change is to mainstream climate change through wise management of resources and enhanced environmental conservation. This should integrate responses into national policies, plans and programmes, and strengthen institutional and implementation capacity resulting in improved economic competitiveness and quality of life.

Five principles set the national direction in responding to the challenges of climate change. The adverse effects and impacts of climate change are recognised and national responses that consolidate economic, social and environmental development goals are mainstreamed based on the following principles:

 Development on a sustainable path: To integrate climate change responses into national development plans to fulfil the country's aspiration for sustainable development;

- Conservation of environment and natural resources: To strengthen implementation of climate change actions that contribute to environmental conservation and sustainable use of natural resources;
- Coordinated implementation: To incorporate climate change considerations into the implementation of development programmes at all levels;
- *Effective participation:* To improve participation of stakeholders and major groups for effective implementation of climate change responses; and
- Common but differentiated responsibilities and respective capabilities: International involvement on climate change will be based on the principle of common but differentiated responsibilities and respective capabilities.

## 3.2.2 New Economic Model and Transformation Programmes

The New Economic Model (NEM) formulated in 2010 aims at transforming Malaysia into a high-income economy that is inclusive and sustainable in both economic and environmental terms. Among the policy measures in the NEM that are relevant to addressing climate change are:

- Follow international standards on sustainability: including to address climate change, such as emission reductions, providing incentives for the deployment of low-carbon energy technologies to reduce carbon emissions, and enforcing clean air and water standards;
- Internalise externalities: including rationalisation of subsidies and removal of price controls on energy to encourage the adoption of renewable and green technologies in the long run;
- Promote green growth and energy efficiency through adoption of energy efficiency standards, together with the greater use of alternative renewable green energy sources;

- Strive for energy resource sustainability: including the introduction of new and renewable resources and establishment of a transparent priority-based ranking system for research and development and use of green energy technology so that the private sector can readily invest, such as in downstream projects related to nonfossil based energies; and
- **Favour sustainable agriculture:** including setting standards on sustainable agri-food production and distribution, such as organic food standards.

The NEM is operationalised through the Economic Transformation Programme (ETP) containing six Strategic Reform Initiatives (SRIs), and 12 National Key Economic Areas (NKEAs), implemented through Entry Point Projects (EPPs). Implementation of the ETP began under the Tenth Malaysia Plan (2010-2015) and continues through the Eleventh Malaysia Plan (2016-2020). The NKEAs and their EPPs relevant to climate change issues are discussed under the relevant cross-sectoral and sector-specific initiatives in sections 3.3 and 3.4.

The other pillar of implementation of the NEM is through the Government Transformation Programme (GTP), which aims to strengthen public services in the National Key Result Areas (NKRAs). The aim is to enhance governance and efficiency in Government institutions, which are accountable and consultative, and whose performance will be measured against performance-based outcomes. Relevant to the topic of addressing climate change, the NKRAs include one on *Improving Urban Public Transport*, which is discussed in section 3.4.2.

## 3.2.3 Tenth and Eleventh Malaysia Plans

The foundation for addressing climate change in a more coherent manner was established in the Tenth Malaysia Plan (2011-2015). The Tenth Malaysia Plan expressed the Government's commitment to, *inter alia*, "building an environment that enhances the quality of life". Among the strategies identified was the valuing of the nation's environmental endowments, with focus on developing a climate resilient strategy and enhancing conservation of the ecological assets. Development of climate resilient strategy was two-pronged: firstly, adaptation strategies to protect the nation from the impacts of climate change; and secondly, mitigation strategies to reduce GHG emissions.

The Eleventh Malaysia Plan (2016-2020) takes these efforts further by having a strategic thrust on *Pursuing Green Growth for Sustainability and Resilience.* The fundamental shift is towards a development model that views resilient, low-carbon, resource-efficient and sociallyinclusive development as an investment that will yield future gains.

Thrust four of the Eleventh Malaysia Plan focusses on four key areas in pursuing green growth namely:

- Strengthening the enabling environment for green growth, particularly in terms of the policy and regulatory framework, technology human capital, areen investment and financial instruments. The strategies by which this will be done are through strengthening governance, enhancing awareness and establishing sustainable financing mechanisms. The latter is crucial due to the high costs of adaptation and mitigation measures, including that required for the acquisition of related technologies;
- Adopting the sustainable consumption and production concept, so that the economy is shifted accordingly, particularly in the private sector. The Government is committed to lead in creating green markets through Government Green Procurement (GGP), while promoting the adoption of criteria for green buildings and strengthening green certification. The share of renewables in the energy mix will be increased, while demand side

management (DSM) will be enhanced. Low-carbon mobility through the utilisation of energy-efficient vehicles and public transportation will be promoted. Waste will also be managed holistically through better coordination, encouraging reduction, reuse and recycling and using waste as a resource for other industries;

- Conserving natural resources for present and future generations, so that their function as natural buffer against climate change and natural disasters will be strengthened. The conservation of Malaysia's forests is also seen as a key effort to protect carbon sinks and to reduce emissions from deforestation and forest degradation; and
- Strengthening resilience against climate change and natural disasters to protect people and development gains as well as to ensure the standards of living enjoyed by people today still continue to rise for future generations.

### 3.3 Cross-Sectoral Initiatives

### 3.3.1 A Roadmap of Emissions Intensity Reduction in Malaysia

In 2010 a study was initiated to comprehensively analyse mitigation prospects, potential and strategies across various sectors, make recommendations, and delineate a mitigation roadmap for Malaysia. The sectors include energy, industrial processes, agriculture, LULUCF and waste.

The analysis time frame of the study is from 2005 to 2030 and examines business-as-usual (BAU) and mitigation scenarios. The study indicates that there are opportunities across various sectors to meet Malaysia's voluntary reduction of up to 40% emissions intensity of GDP by 2020. However large efforts including adequate finance, appropriate technologies, the right skill sets and enabling policies and institutional environments would be required to achieve the emissions intensity reduction.

### 3.3.2 National Green Technology Policy

The National Green Technology Policy was launched in 2009 to spearhead the development of the green technology sector in the country. The Policy has the following five main objectives:

- Decreasing growth of energy consumption while enhancing economic development;
- Facilitating growth of the green technology industry and enhancing its contribution to the national economy;
- Increasing national capabilities and capacity for innovation in green technology development and enhancing Malaysia's green technology competitiveness in the global arena;
- **Ensuring sustainable development** and conserving the environment for future generations; and
- Enhancing public education and awareness of green technology and encouraging its widespread use.

Concurrently, the Green Technology Financing Scheme (GTFS) was set up in 2009 with a funding of RM1.5 billion. It has since been augmented with an additional RM2 billion to encourage companies, especially small and medium-sized enterprises, to use green technologies in their operations. The implementation of projects under the GTFS has since resulted in an estimated reduction in GHG emissions of 94.81 kt CO<sub>2</sub>eq in 2013.

At the implementation level, the EPP on *Jumpstarting a Vibrant Green Technology Industry* further focuses on raising Malaysia's profile as an Asian green technology hub and on increasing the capabilities of the local industry. Investments in the industry reached RM2.59 billion in 2014, surpassing the target of RM2 billion. Forty-five projects worth RM438 million were approved under the GTFS in 2014. Subsequently a master plan on green technology is being drafted by the Ministry of Energy, Green Technology and Water. Several policy initiatives provided the building blocks for that master plan, including an initial foresight study focussing on energy, manufacturing, transportation, building, waste, water, information and communication technology, agriculture and forestry sectors; an inventory of green growth and green economy initiatives; a regulatory framework analysis exploring statutory options for green technology development and application; an economic assessment of green businesses; an impact assessment of current and previous incentives; a green tax incentives framework and implementation; and an exploration of green financial institutions for green investment.

### 3.4 Sector-Specific Initiatives

### 3.4.1 Energy Management and Conservation

While the oil, gas and energy EPPs under the ETP focus on developing the sector further, some attention is also paid to energy efficiency and renewable energy such as solar and hydroelectric power, as alternatives to fossil fuels. Similarly, during the Eleventh Malaysia Plan, the optimisation of the fuel mix and exploration of alternative fuels will be given priority to reduce the nation's dependency on fossil fuels for electricity generation.

The Government has further committed to ensuring that future power plants must incorporate more stringent emission control technologies to ensure a progressive reduction of the energy industry's carbon footprint. The use of clean and green energy sources in power generation will also be made a priority and is expected to increase substantially in the generation mix. Nonetheless, challenges remain for the energy sector, for example, national priorities on energy security spelled out in the Eleventh Malaysia Plan dictate that the share of coal in the total electricity generation mix is anticipated to increase to 53% by 2020.

### 3.4.1.1 Energy Efficiency

It has been recognised that energy efficiency measures will go a long way in addressing climate change, with multiple benefits of emissions reduction, energy and cost savings, and cleaner air. The Efficient Management of Electrical Energy Regulations 2008 aims to ensure that high electrical energy users or generators, with a total electrical energy consumption or generation, respectively, equal to or exceeding 3,000,000 kWh over any period not exceeding six consecutive months, put in place measures for efficient electrical energy management. These include obligations to appoint or designate a registered electrical energy manager and to report net energy usage and measures implemented for efficient electrical energy management to the Energy Commission. The Commission and related agencies are currently working to improve the regulations for all industry players to adhere to the regulations and to improve the efficiency of their installation.

Efforts were made during the Tenth Malaysia Plan via the EPP on *Improving Energy Efficiency* to address energy demand management through the Minimum Energy Performance Standards (MEPS) for domestic appliances, which were gazetted in 2013. In an effort to raise awareness, a two-year programme called the Sustainability Achieved via Energy Efficiency (SAVE) Programme (2011-2013) was implemented under which households were offered rebates of RM100 and RM200 for any purchase of new energy efficient refrigerators and air conditioners for domestic use as well as RM200 per refrigerant tonne (RT) of chillers replacement.

This programme is estimated to have reduced energy consumption by 306.9 GWh over the lifetime of the programme. Moreover, pilot projects for energy audits and retrofitting of selected Government buildings has been implemented. The retrofitting of four Government buildings located in Putrajaya is estimated to have reduced electricity use ranging from 4 - 19% monthly, equivalent to RM7,000–RM130,000 in savings.

Demand Side Management is spelt out in the Eleventh Malaysia Plan and marks an important paradigm shift towards further efficient management of energy resources. This initiative aims to give due emphasis to the demand side for a balanced management of the entire energy spectrum. One of the goals of DSM is to encourage consumers to use less energy during peak hours and to move the time of energy use to off-peak hours. This is also known as Enhanced Time of Use (EToU) where for domestic consumers it is anticipated to build on the MEPS programmes initiated during the Tenth Malaysia Plan. A comprehensive long-term DSM master plan will need to be formulated to steer prudent energy usage in Malaysia. The scope of the proposed DSM master plan will include electric and thermal energy, and usage in the transport sector.

Likewise, the National Energy Efficiency Action Plan (NEEAP), which is currently at the final stage of its development, is focussed on tackling issues pertaining to energy supply by managing demand efficiently. The Plan will prescribe a path towards improving energy efficiency by pursuing the implementation of measures that are considered as "harvesting the low hanging fruits", as they are mutually viable for the country's economic growth and enhancing social well-being. It is targeted for implementation in 2016.

Although the private sector is anticipated to be the key contributor to the success of the NEEAP, it is however recognised that to obtain widespread acceptance of the action plan, the role of Government in leading this initiative is crucial. The Government will, through circulars, direct its ministries and agencies to practise energy efficiency in its operations. Initial implementation of energy audits and management of Government buildings has already yielded encouraging results through the Government Lead by Example (GLBE) initiative. Through efficient electricity consumption practices in Federal Government Ministry buildings, an emissions reduction of approximately 10.94 kt CO<sub>2</sub>eq was achieved in 2014.

During the Eleventh Malaysia Plan period, measures are also planned to identify potential improvements and appropriate approaches to ensure the efficient use of energy in buildings, industries and households. These include actions to increase the competencies of energy service providers, promote the implementation of Energy Performance Contracting (EPC), enhance user awareness on energy labelling, promote the availability of standards such as ISO 50001 and MS1525 for buildings and MEPS for appliances, gradually abolish the Special Industrial Tariff (SIT) for energy-intensive industries and implement infrastructure related initiatives such as smart grids and highly efficient co-generation technologies for combined heat and power systems.

In terms of energy efficiency in buildings, the promotion of "green buildings" will not only reduce emissions, but also ensure the efficient use of resources, particularly of energy and water. In this respect, the Eleventh Malaysia Plan foresees that new government buildings will adopt green features and designs and use green building materials in accordance with existing standards such as Skim Penarafan Hijau Jabatan Kerja Raya Malaysia (Malaysia Public Works Department Green Rating Scheme). Existing Government buildings will be gradually retrofitted while industry players will be encouraged to obtain green certification such as GreenPASS and the Green Building Index, for private buildings. GreenPASS which uses Building Energy Index (BEI) and carbon reduction assessment to rate the degree of energy efficiency of buildings will be further promoted in the country. In 2013 the implementation of green building rating scheme has resulted in 60.4 kt CO2eq emissions reduction.

### 3.4.1.2 Renewable Energy

Renewable energy was first identified as the "fifth fuel" resource under the Eight Malaysia Plan (2001-2005) in addition to the other four energy resources consisting of oil, gas, coal and hydropower. The Renewable Energy Policy and Action Plan was adopted in 2010, the Renewable Energy Act legislated in 2011 and the Sustainable Energy Development Authority formed to provide the impetus for greater use of renewable energy in electricity generation. The renewable energy sources that are identified in the Policy and Action Plan are palm oil biomass wastes and palm oil mill effluents; mini-hydro; solar power; solid waste and land-fill gas; and wastes and gases from agro-based and farming industries. However, the detailed resource potentials have not been fully examined and verified yet for wastes and gases from agro-based and farming industries. Electricity generation capacity through renewable sources including biomass, biogas, solar photovoltaics and mini hydro are projected to reach 7.8% of total installed capacity in Peninsular Malaysia and Sabah by 2020, or about 2,080 MW.

The Tenth Malaysia Plan set a renewable energy target of 985 MW by 2015. Under the ETP, several EPPs have focussed on renewable energy in particular the EPP on Building Up Renewable Energy and Solar Power Capacity and the EPP on Tapping Malaysia's Hydroelectricity Potential. Solar power is expected to contribute at least 220 MW to the country's total capacity mix. Several policy measures and incentives were initiated to achieve this, including the introduction of a FiT with a clear buy-back mechanism that allowed locally produced electricity to be sold to power utilities at a fixed premium over a specific period and that spurred investment in renewable energy; and the establishment of a Renewable Energy Fund to support renewable energy development. The installed capacity of the FiT renewable energy has since grown to 148 MW in 2013. Renewable energy generation from the FiT and non-FiT public regulated and

private licensees has contributed to a reduction of 1201.55 kt CO<sub>2</sub>eq in 2013.

The EPP on *Developing Biogas Facilities at Palm Oil Mills* encourages palm oil mills to capture methane via biogas trapping facilities. The objective is to ensure that mills capture methane to generate electricity for supply to the national grid or for their own use. The estimated potential energy generated from biogas in Malaysia is 1.88 million MWh of electricity. The EPP aims to develop biogas plants at the 500 mills over the next 10 years. In 2014, the Government mandated new palm oil mills and mills that are expanding their capacity to install methane avoidance facilities. Biogas capture from palm oil mill effluent has reduced emissions by 300.95 kt CO<sub>2</sub>eq in 2013.

The National Biofuel Policy 2006 had already laid the ground for these initiatives, by focussing on the transport sector (using B5 diesel for land and sea transport, a blend of 5% processed palm oil and 95% petroleum diesel); supplying B5 diesel to the industrial sector; research, development and commercialisation of biofuel technologies; supplying the growing global demand for biofuel; and focussing on biofuel as a means to minimise the emission of GHGs. The National Biofuel Industry Act 2007 was further put in place to regulate the biofuel industry in Malaysia and to promote the mandatory use of the B5 domestic palm biodiesel.

Nonetheless, there have been challenges in implementing the biofuel mandate throughout Malaysia, including logistical, infrastructure and distributional capacity challenges. To support the implementation of the biodiesel B5 Programme, 35 depots were constructed nationwide with in-line blending facilities during the Tenth Malaysia Plan. This has been an important effort, as there have been infrastructural, logistical and distributional challenges in implementing the B5 Programme. Development and usage of palm oil-based biodiesel in blended petroleum diesel had reduced emissions by 719.74 kt CO<sub>2</sub>eq in 2013. At the end of 2014, Malaysia had also introduced the bio-diesel B7 Programme (7% bio-diesel blending) nationwide under the EPP on Commercialising Second Generation Biofuels. The EPP on Commercialising Second Generation Biofuels (B7 and higher) focus is on biofuels that are produced from nonfood biomass, with targets to fast-track the commercialisation of palm biomass-to-liquid technology to generate electricity, fire up boilers and fuel diesel engines. Investment in Sarawak has been secured to create Southeast Asia's first biomass processing hub, while a bio-oil plant capable of producing 30 MW of energy is planned near Lahad Datu, Sabah. The plan is to then progressively upgrade to the B10 Programme.

The ASEAN Meeting of Energy Ministers in September 2014 adopted a new definition of renewable energy that includes all types of renewable energy sources including large capacity hydro dams. However, in line with the Renewable Energy Act 2011, the Malaysian Feed-in Tariff programme is only applicable for installations with less than 30 MW installed capacity.

The EPP on *Tapping Malaysia's Hydroelectricity Potential* aims to increase the use of hydroelectricity in the country in a responsible and sustainable manner. In 2014, 17 areas in Sabah were identified as potential sites for small hydropower development. Installed capacity of small hydro under the FiT programme reached 15.70 MW by the end of 2013.

The Eleventh Malaysia Plan will further focus on promoting new renewable energy sources. Other sources such as wind, geothermal and ocean as well as off-grid renewable energy facilities will be explored and promoted.

### 3.4.2 Transport

The transport sector accounts for a significant amount of emissions and energy demand in Malaysia. Therefore, the implementation of public transport initiatives is critical to reduce the use of private vehicles on the roads and consequently, to reduce emissions. The Land Public Transport Commission was established in 2010 and subsequently launched its National Land Public Transport Master Plan (2012-2030) to promote integrated planning of public transportation and management of the growth of private vehicles. It explicitly targets an increase of 40% in the public transport share in urban areas by 2030.

The emphasis on public transport is also reflected in the GTP, with the Urban Public Transport NKRA focussing on increasing public transport ridership in key urban areas in several States, improving reliability and journey times, enhancing comfort and convenience, as well as ensuring first- and last-mile accessibility. The EPP *Building an Integrated Urban Mass Rapid Transit System* is a key driver in growing the public transport modal share.

During the Tenth Malaysia Plan, major public transport projects were initiated. The major effort encompasses the expansion of the Kuala Lumpur Light Rail Transit (LRT) coverage and the implementation of the Mass Rapid Transit (MRT) system as major investment priorities. Construction of the MRT Line 1 started in 2012 and is expected to be operational in 2017. Initiatives carried out under the Tenth Malaysia Plan have so far enabled a 31.7% increase in the annual ridership of urban rail in the Greater Kuala Lumpur/Klang Valley area to 226 million in 2014. The Klang Valley Mass Rapid Transit (KVMRT) system is expected to become operational during the Eleventh Malaysia Plan. The KVMRT Line 1 will traverse 51 km through 31 stations, serving about 1.2 million people with a daily expected ridership of 400,000. Construction on KVMRT Line 2 will start in 2016 and is estimated to become operational by 2022. Additionally, construction on Light Rail Transit (LRT) Line 3 running over 36 km and serving 25 stations will start in 2016 with expected completion in 2020. Outside this area, the electrified double-track railway from Perlis to Negeri Sembilan operated by *Keretapi Tanah Melayu Berhad* has also been completed. In 2013 the Klang Valley urban railbased public transport has led to an emissions reduction of 214.93 kt CO<sub>2</sub>eq.

For buses, an additional 470 new buses were provided for the following services – Rapid KL, Rapid Kuantan and Rapid Penang – leading to significant increases in passenger ridership. The Go-KL free bus service was introduced in 2013 to ease road congestion during peak hours in the Kuala Lumpur central business district. Stage bus annual ridership showed a mixed performance with an increase in four capital cities and a decrease in seven other cities from 2012 to 2014. The Stage Bus Services Transformation (SBST) Programme was introduced in 2015 to improve operator viability and expand route coverage. The SBST Programme was rolled out to five cities in 2015.

Integration between transport modes was also enhanced by providing first- and last-mile connectivity including by extending pedestrian walkways, building parking facilities at terminals, and revitalising inter-urban terminal hubs. In the Greater Kuala Lumpur/Klang Valley region, the public transport modal share improved from 16.9% in 2010 to 18.1% in 2014, while the morning peak hour ridership increased to 799,992 passengers in 2014. Network coverage, measured by population living within 400 metres of public transport nodes, improved from 63% in 2010 to 72% in 2014.

To take these efforts further, the Eleventh Malaysia Plan adopts the concept of "lowcarbon mobility", which emphasises the usage of public transport. Further public transport investments in cities – including additional MRT lines in Greater Kuala Lumpur/Klang Valley and bus systems in other State capitals – are planned in line with the declared targets of achieving 40% public transport modal share in Greater Kuala Lumpur/Klang Valley and 20% in other cities. Rural, rural-urban and inter-city connectivity will also need to be strengthened, so as improve availability, reliability and convenience. The transitoriented development (TOD) concept will also be promoted to optimise land use and public transport infrastructure planning. As such, planning for the development of road and rail networks should be better integrated to promote a multimodal transport system.

Other efforts to reduce energy consumption and air pollution from road vehicles have also reduced GHG emissions. These efforts include the use of compressed natural gas (CNG), the promotion of energy-efficient vehicles (EEVs) and the adoption of higher fuel standards. The use of compressed natural gas (CNG) by vehicles started in late 1990s; however, adoption has been limited to predominantly taxi and a number of bus fleets in specific areas in Peninsular Malaysia. This usage has led to a reduction of 154.62 kt CO<sub>2</sub>eq in 2013. The National Automotive Policy (NAP) 2014 specifies that 85% of the vehicles produced in Malaysia by 2020 would be EEVs. The Government is particularly committed to increase the adoption of EEVs for public transport. In 2013 the use of EEVs has reduced emissions by 40.96 kt CO<sub>2</sub>eq.

The Eleventh Malaysia Plan also calls for accelerating the utilisation of more environmentally friendly fuel. The Government gazetted EURO 4M standards in 2013 and enforced its use in RON 97 in 2015. The plan is to extend EURO 4M standards to RON 95 petrol and EURO 5 standards to diesel.

### 3.4.3 Waste Management

The waste sector in Malaysia accounted for the second largest share of emissions in 2011, and emissions from the sector have been rising due to increasing population and consumption. To address this problem, the EPP on *Developing an Efficient Solid Waste Management System* identified four initiatives: encouraging greater implementation of the Reduce, Reuse, Recycle (3R) programme; increasing waste treatment

capacity to reduce reliance on landfills; improving the governance of solid waste management and public cleaning services; and assessing the potential of new technological developments such as automatic waste collection and the use of deep bins.

The 3R programme was intensified during the Tenth Malaysia Plan, which saw household recycling rates rise from 5.0% in 2010 to 10.5% in 2012. The Government has set a goal of attaining a 22% household recycling rate by 2020. Waste separation at source for households is being implemented in selected States starting in September 2015 in line with the enforcement of the Solid Waste and Public Cleansing Management Act 2007. In 2013, the waste paper recycling industry reduced emissions by 1,993.47 kt CO<sub>2</sub>eq.

The Eleventh Malaysia Plan further envisages that all seven types of waste – solid, agricultural, construction, radioactive, mining, sewage, and scheduled waste – will be managed in a holistic manner based on a life-cycle approach. This approach extends beyond merely disposing the waste, and instead aims to increase investment to channel waste away from landfills to be used as resource, either converted to energy or used as an input for other products.

### 3.4.4 Land Use, Land-Use Change and Forestry

The LULUCF sector plays a key role in Malaysia's actions to address climate change. This sector remains a net sink while contributing to the nation's GDP. It is thus imperative that efforts are strengthened to maintain and enhance the country's forest reserves.

The Tenth Malaysia Plan included a chapter on *Valuing Our Environmental Endowments*, wherein enhancing forest management was one of the priorities. The Natural Resources Conservation Trust Fund was established in 2013 to further enhance sustainable forest management and conservation of biodiversity. The Central Forest Spine (CFS) in Peninsular Malaysia and the Heart of Borneo (HoB) in Sabah and Sarawak are enablers to increase connectivity between forests and to reduce fragmentation while improving natural resource management. The Government has allocated about USD30 million for these projects between 2010 and 2015. In 2013, approximately 53,750 ha have been gazetted as Permanent Reserved Forest. This has contributed to emissions reduction of 13,797.37 kt CO<sub>2</sub>eq.

The Eleventh Malaysia Plan aims to have 17% of terrestrial and inland water areas gazetted as protected areas by 2020. Reforestation and forest enrichment efforts will also be carried out in affected areas to improve degraded forests. Meanwhile, measures to reduce illegal logging activities and forest degradation will be taken through stricter enforcement. In an effort to provide alternative livelihood, the tourism EPP Establishing Malaysia Mega Biodiversity Hub aims to provide employment and business opportunities from ecotourism. This will require a comprehensive system to monitor and conserve the country's natural attractions, including its biodiverse forests, which are critical carbon sinks. These initiatives will promote responsible tourism and foster sustainable management of natural ecosystems.

In addition, the REDD+ Strategy is also being developed for Malaysia. The Strategy outlines policy actions to ensure at least 50% of Malaysia's land mass remains forested. This is achieved through enhancing sustainable management of forest and conservation activities. In this vein, the National Forestry Policy is being revised to include addressing climate change challenges.

In line with the aim to maintain at least 50% of forest cover, both upstream and downstream activities of the palm oil sector are being addressed/improved. As of 2011, about 5 million ha were planted with oil palm in Malaysia and the maximum additional arable land for this crop is estimated at 1.0 million ha. The anticipated increase in global demand for vegetable oil will be met through increased oil yield. Under the NKEA, the average oil yield is targeted at 6 t/ha/yr and fresh fruit bunch (FFB) yields to increase from the current 21 t/ ha in 2009 to 26 t/ha by 2020. Environmental performance regulations and sustainability criteria are complied with through the Malaysian Sustainable Palm Oil (MSPO), Roundtable on Sustainable Palm Oil (RSPO) and other sustainability certification schemes. Currently, most big oil palm plantations are MSPO or RSPO certified to ensure environmental sustainability.

### 3.4.5 Agriculture

Agriculture accounts for 5% of GHG emissions in Malaysia in 2011. Emissions are primarily from the agricultural soils and efforts are being made to optimise fertiliser application.

The development of the agriculture sector in Malaysia is guided by the National Agro-food Policy (2011-2020) and the National Commodity Policy (2011-2020), which aim to increase food production and exports of industrial commodities. The objectives of the National Agro-food Policy are to ensure adequate food security that is safe to eat; to make the agrofood industry competitive and sustainable; and to increase the agro-based entrepreneur's level of income.

Two certification schemes guide sustainable agriculture implementation in Malaysia. The Malaysian Organic Scheme (currently known as MyOrganic) is a certification programme to recognise organically cultivated farms which do not use chemical pesticides and synthetic fertilisers. It was launched in 2007 and sets out the requirements for the production of, labelling and claims for organically produced foods. The requirements cover all stages of production, including farm operations, preparation, storage, transport and labelling. It is based on Malaysian Standard MS 1529:2001 - The production, processing, labelling and marketing of plant-based organically produced foods.

The Malaysian Good Agricultural Practices (MyGAP) was launched in 2013 and is a comprehensive certification scheme for the agricultural, aquaculture and livestock sectors. MyGAP is a rebranding of Malaysian Farm Scheme for Good Agriculture Practices introduced in 2002, Livestock Farm Practices

Scheme and Malaysian Aquaculture Farm Certification Scheme. The agricultural practices promoted in MyGAP place emphasis on environmental, economic and social aspects to ensure safe and good quality produce. Among other objectives, MyGAP aims to reduce environment pollution and assist in developing an environmentally friendly and sustainable national agricultural industry. MyGAP is an ETP initiative under the *SRI Competition, Standard and Liberalisation*, which is an enabler to the Agriculture NKEA. Under the Eleventh Malaysia Plan, incentives will be provided to further enhance the implementation of MyGAP.

### 3.5 List of Mitigation Actions and their Effects

The policies and programmes identified in the previous sections all yield direct or indirect environmental benefits. Currently only a subset of these can be adequately quantified in terms of greenhouse gas emissions reductions. In 2013 a total of 18,578.80 kt CO<sub>2</sub>eq emissions were reduced.

| Sector | Mitigation Action   | Emission Reduction<br>Achieved in 2013 (kt CO <sub>2</sub> eq) |           | Potential Emiss<br>in 2020 (P                      |           |

### 3.6 Domestic Measurement, Reporting and Verification

Measurement, reporting and verification (MRV) of mitigation actions in Malaysia are coordinated by the Ministry of Natural Resources and Environment (NRE). Monitoring and measurement of emission reductions associated with mitigation actions are at different levels of integration into the functions of the implementing agencies. The mitigation action data is collated by the Technical Working Group (TWG) on Mitigation and verification will be conducted by the Technical Working Group on Verification. The TWG members are multi-agency experts appointed by the Chair of the National Steering Committee on Climate Change. An overview of the domestic MRV process under development is shown in Figure 3.1. Guidelines for MRV of mitigation actions are being developed and tested.

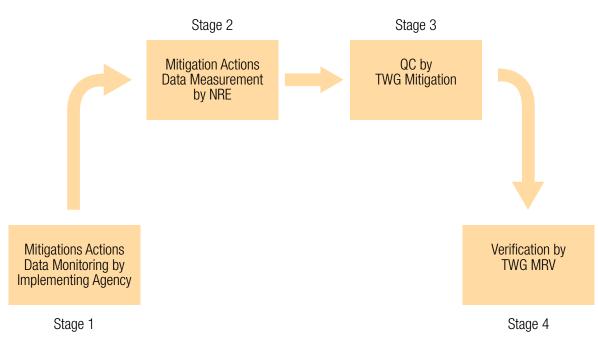

### 3.7 International Market Mechanisms

### 3.7.1 Clean Development Mechanism

Malaysia ratified the Kyoto Protocol on 4 September 2002, prompting establishment of the national strategy on Clean Development Mechanism (CDM) which took into account both the short- and long-term perspectives of the country's position with regard to climate change mitigation measures. Through participation in the CDM under this Protocol, Malaysia has benefited from investments in GHG emission reduction projects which have contributed towards the overall improvement of the environment in line with its national sustainable development goals.

As of April 2015, Malaysia has a total of 143 CDM projects and five Programme of Activities (PoAs) with ten Component Project Activities (CPAs) registered with the CDM Executive Board. This forms 1.9% of the total CDM project activities under the Kyoto Protocol. These projects involved an estimated investment of USD1,529.65 million. Up to the end of the first Kyoto commitment period, the projects were expected to yield 23.95 million tonnes CO<sub>2</sub>eq of emissions reduction. Of these, a total of 9,844,435 CERs have been issued. Since 2013, Malaysia's CDM activities have been much curtailed due to decline and uncertainty of the carbon markets.

Figure 3.1: Measurement, Reporting and Verification Process for Mitigation Actions

The bulk of the project activities are associated with oil palm processing residues, focussing on biomass energy, methane capture and co-composting using either the solid or liquid wastes, or both. Collectively, these oil palmrelated project activities account for 78.3% of Malaysia's CDM pipeline of registered projects, contributing to 63.2% of the total potential emission reduction. Table 3.7 shows the distribution of CDM project activities, categorised according to project type, along with their potential annual emission reductions and reported investments.

### 3.7.2 Voluntary Carbon Market

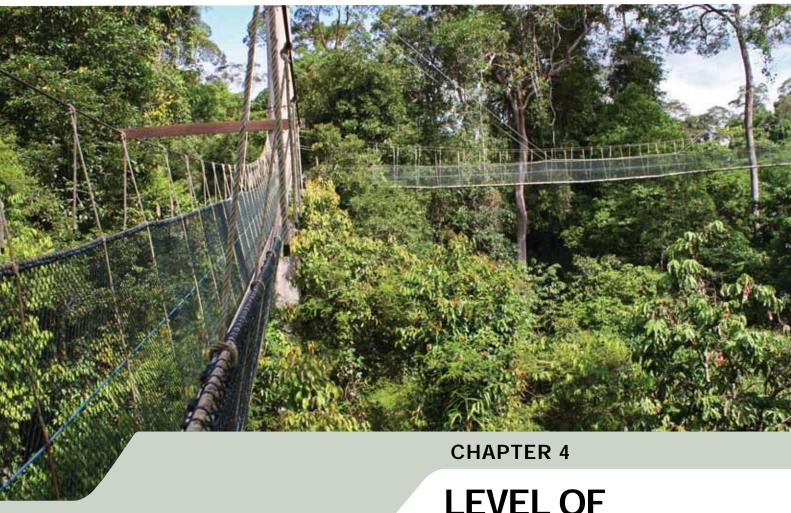

In addition to the CDM, Malaysia participated in 11 voluntary carbon market projects which were validated to the criteria of the Verified Carbon Standard (VCS). Of these, eight were methane emission avoidance projects, and one each were biomass energy, hydropower and reforestation projects respectively. Table 3.8 shows the status of these projects.

### Table 3.8 Distribution of Voluntary Carbon Market Project Activities by Project Type (as at April 2015)

### LEVEL OF SUPPORT

# CHAPTER 4: LEVEL OF SUPPORT

#### 4.1 Introduction

Efforts by Malaysia to reduce its GHG emissions and enhance its resilience to the increasing impacts of climate change have been supported by both national and international resources. As per Article 4.3 of the UNFCCC, Malaysia has received capacity building, technical and financial support from international sources to enable the country to fulfil its obligations under the Convention and to better implement actions to address climate change. This chapter only describes the support received by federal agencies to specifically address climate change. Support received at sub-national level is reported to the extent possible. It does not include financial support received directly by private and nongovernment entities. The manner in which international funds have been channelled has not enabled tracking and clear identification of the support.

#### 4.2 Support Received

Malaysia has been a beneficiary of various assistance from bilateral and multilateral agencies in the form of technical as well financial assistance. The bulk of the financial support has been provided through the Global Environment Facility (GEF), the operating entity of the financial mechanism of the UNFCCC. Since the entry into force of the UNFCCC, the total amount of funding received from GEF for climate change activities is USD46,510,020 from GEF cycle 1 to GEF cycle 5. Table 4.1 shows the amount received during each GEF cycle.

## Table4.1 Summary of Global Environment<br/>Facility Funding on Climate Change<br/>Activities to Malaysia

| GEF<br>Cycle | Period                | Approved<br>Amount (USD) |
|--------------|-----------------------|--------------------------|
| 1            | July 1994 – June1998  | 7,770,600                |
| 2            | July 1998 – June 2002 | 4,000,000                |
| 3            | July 2002 – June 2006 | 8,699,420                |
| 4            | July 2006 – June 2010 | 11,800,000               |
| 5            | July 2010 – June2014  | 14,240,000               |

The support received has focussed mainly on enhancing Malaysia's institutional and technical capacity on reporting obligations to the UNFCCC and implementing mitigation actions. These have been channelled through the United Nations Development Programme (UNDP) United Nations and Industrial Development Organisation (UNIDO) in Malaysia. The projects for the period from 2010 are listed in Table 4.2. The information was compiled to the extent possible from various

sources identified as providing funding for climate change activities.

The mitigation projects focussed on energy efficiency of buildings and the manufacturing, industrial and transport sectors. Clean and green technologies were another focus area, with projects targeting small and medium enterprises and low-carbon cities. Projects on low-carbon society, sustainable consumption and production, and the national corporate GHG reporting programme attempt to address climate change more holistically by including key stakeholders, including consumers.

Another important aspect of the support provided has been the focus on strengthening institutional arrangements, given the crosscutting nature of climate change and the challenges presented by Malaysia's federation system.

### 4.2.1 Support Received for BUR

Malaysia would also like to acknowledge the financial support of USD352,000 provided for the preparation of this first biennial update report (BUR). The funds for the BUR have enabled the development of the national GHG inventory and the mitigation analysis for the report. The *Low Emission Capacity Building Programme for Malaysia* project listed in Table 4.2 provided additional funding for capacity building and contributed to the development of the measurement, reporting and verification (MRV) system required to be reported in the BUR.

### 4.2.2 Support for Climate-related Forestry Activities

The Malaysian forestry sector has attracted some interest from the international community to address emissions from this important contributor to the national economy. In the area of forests, a REDD+ readiness programme for mitigation action through strengthening of the institutional framework, assessment of the legal architecture and the financing mechanism was supported as identified in Table 4.2.

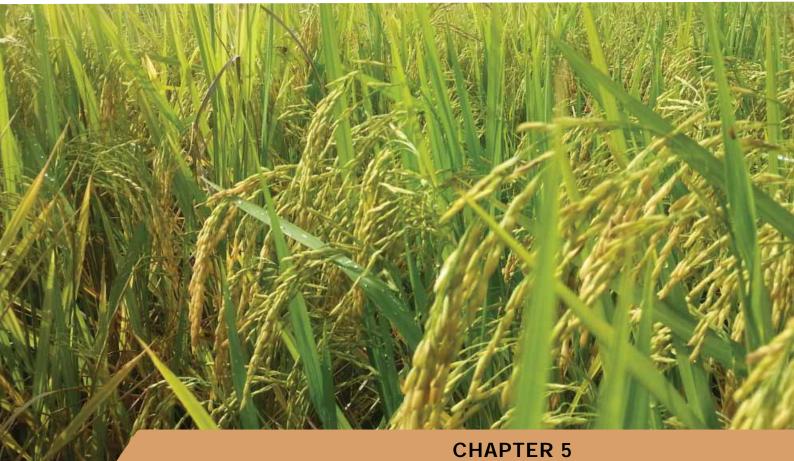

Two initiatives with a regional focus paid particular attention to the strengthening of institutional capacity in technical and policy issues with regard to the potential implementation of REDD+ activities. The United Kingdom Foreign and Commonwealth Office, through its Southeast Asia Prosperity Fund, a technical cooperation programme managed by the British High Commission, provided £35,000 in 2012 and £27,500 in 2013 respectively for REDD+ readiness implementation in Malaysia. The USAID-funded Lowering Emissions in Asia's Forests (LEAF) Programme provided external consultancy expertise for institutional capacity building for a sub-national REDD+ pilot project with the objective of developing market-oriented policies.

More recently, the European Union provided Euro 4 million in funding for a four-year plan (2014-2017) to tackle climate change through sustainable forest management and community development with a sub-national entity in the Borneo region.

### 4.2.3 Other Capacity Building Assistance

Apart from those sources listed in Table 4.2, Malaysia has also received capacity building from the Intergovernmental Panel on Climate Change and a number of Annex 1 Parties. In particular Japan and the United States have helped to enhance the technical capacity of Malaysia's greenhouse gas inventory compilers through the USAID Low Emissions Asian Development (LEAD) Training Programmes and Japan's annual Workshop on GHG Inventories in Asia (WGIA).

The United States Environmental Protection Agency had also extended technical assistance to build Malaysia's capacity in GHG inventories.

CONSTRAINTS, GAPS AND NEEDS

## CHAPTER 5: CONSTRAINTS, GAPS AND NEEDS

### 5.1 Introduction

As a fast-developing country, Malaysia faces challenges in decoupling the growth of its economy from its GHG emissions. Many constraints and gaps exist for the various GHG emitting economic sectors, particularly in terms of technical and capacity gaps. Nevertheless, conscious efforts have been made to reduce the country's carbon footprint while growing its economy.

Like many developing countries, Malaysia is also experiencing the impacts of climate change and challenges to adapt to the changes while ensuring that its development gains are protected. It is critical that the constraints and gaps hindering more systematic and widespread uptake of both mitigation and adaptation efforts are concurrently addressed to avoid loss of mitigation gains.

The constraints, gaps and related needs for GHG inventory, mitigation, vulnerability and adaptation, and research and systematic observation are described below. The constraints, gaps and needs identified here are non-exhaustive. They do not prejudge the need for closer scrutiny and targeted interventions in future assessments.

### 5.2 Greenhouse Gas Inventory

Since the preparation of the NC2, Malaysia has taken steps to ensure retention of institutional memory of technical capacity developed. Conscious efforts have been made to institutionalise the processes, resulting in a structured framework of data collection agencies for the five major sectors identified for GHG inventory estimation. A series of capacity building activities was conducted to enhance knowledge and skills in inventory preparation.

However, challenges remain in the following aspects:

- Activity data limited technical capacity in applying the national data and proxy data to generate the required data for GHG inventory;
- Lack of historical data particularly for the waste, industrial processes and transport sectors;
- Tracking deforestation difficulties in understanding differences of data sets reported in national and international publications;
- Completeness not all sectors were covered to satisfaction due to technical and data gaps described above;

- Development of local emission factors

   difficulties in moving to higher tiers in several key source categories; and
- Uncertainty assessment limited technical capacity in carrying out such assessments.

Nevertheless, since NC2, the application of local emission factors for the forestry sector has expanded to cover the whole of Malaysia. The agriculture sector is also developing its local emission factors.

To overcome these challenges, some possible steps have been identified and actions taken:

- A centralised data collection and compilation mechanism to ensure the quality, consistency and reliability of inventories is being developed;
- Subsectors identified in the GHG Inventory improvement plan as "not yet reported" will be explored for future inclusion;
- Efforts are being taken to enhance the collection of identified missing historical activity data from key sectors to meet new IPCC requirements;
- To address data confidentiality issues, particularly in the energy and industrial processes sectors, a memorandum of understanding between the sectors and the central statistic compilation agency is being explored;
- Increase greater cooperation with data providers from the private sector;
- Enhance research and development of local emission factors; and
- Continuous capacity building to increase the pool and capability of GHG inventory compilers and data providers.

All efforts would require substantial continued technical capacity development, financial assistance and international collaboration.

### 5.3 Mitigation

The key mitigation areas identified in the Chapter on "Mitigation Actions and Their Effects" are to increase renewable energy in the energy mix, energy efficiency, land transportation, waste management, and protection of forest carbon pools. Efforts in these areas have gained traction but have faced some persistent constraints in the areas of institutional arrangements, as well as in the regulatory and financial support needed to create an enabling environment for speedy implementation of mitigation actions.

### 5.3.1 Energy Security

Coal has established a strong foothold under the country's four fuel diversification policy since 1981, with the share of coal in the total electricity generation mix projected in the Eleventh Malaysia Plan to increase to 53% by 2020. This highlights the energy security challenge faced by Malaysia amidst the need to control its carbon emissions level. As a result, switching from conventional sub-critical plants to supercritical and ultra-supercritical plants and even integrated gasification combined cycle technology has become a necessity for the long-term. However, the high capital investment is posing yet another financial burden to achieving emission reductions in this growing source of energy generation.

### 5.3.2 Renewable Energy

The Renewable Energy Fund started in 2011 for the promotion of renewable energy through a FiT mechanism. The fund is supplemented through a 1% additional collection on the monthly electricity bill exceeding 300 kWh. The rate was increased to 1.6% in January 2014. Nevertheless, the fund is still insufficient to enable a wider deployment of renewable energy through the FiT mechanism.

This is evident from the gap between the actual achievement and the target set out in the

Tenth Malaysia Plan, largely due to financial barriers. In spite of this, Malaysia is aiming to increase the target to 2,080 MW during the Eleventh Malaysia Plan period, with other planned mechanisms contributing towards achieving the target. Access to international financial assistance, capacity development and technology transfer would facilitate greater deployment of renewable energy. Table 5.1 provides a list of mitigation actions in the energy sector that require funding, clearly demonstrating the financing needs for this area. Solar photovoltaics (PVs) have high potential for growth for both commercial and individual residential installations. Solar PVs contributed 47% of the FiT installed capacity in 2013, of which 16% of the capacity is from individual installations through the *Solar Rooftop Programme*. This programme was wellreceived by the general public as shown by the 92.6% contribution of the solar PV individual subcategory to the overall FiT approved applications in 2013. The acceleration of solar PV technology transfer will further reduce the cost of renewable electricity and hasten the achievement of grid energy price parity with fossil-generated electricity.

| Activity   | Status  | Support needed<br>(Finance)                                | Support needed<br>(Technical/<br>Technology)                                | Remarks  |
|--|---|--|---|--|
| FiT – solar PV<br>(individual)                   | Ongoing<br>(since 2011)                           | RM300mil/year<br>until 2037                                | None  | Will be able to continue with<br>release of new PV quota till<br>2020, instead of ending in<br>2016/2017.  |

This amount is<br>for another estimated 70 MW<br>resource.  |
| FiT – geothermal<br>resource<br>assessment study | Ongoing<br>(since 2012)                           | RM30mil<br>(one-off)                                       | Technical support on resource assessment                                    | Estimated 100 MW resource<br>available in Tawau area; needs<br>a detailed study to confirm<br>resource.  |
| FiT – biomass                                    | Ongoing<br>(since 2012)                           | RM150mil/year<br>until 2032                                | None  | Will double the quota release<br>for biomass from the years<br>2016 to 2025.   |
| FiT – biogas                                     | Ongoing<br>(since 2012)                           | RM100mil/year<br>until 2032                                | None  | Will double the quota release<br>for biogas from the years 2016<br>to 2025.  |
| FiT – wind resource<br>mapping                   | Ongoing<br>(since 2012)                           | RM100mil<br>(one-off)                                      | Technical support for offshore wind mapping                                 | Present project is for onshore<br>wind mapping under the<br>Malaysian Electricity Supply<br>Industry Trust Account grant.<br>Proposed new project for<br>offshore wind mapping off the<br>coasts of Kelantan, Terengganu<br>and Sabah. |
| Storage technology                               | New project                                       | RM50mil (pilot<br>project including<br>study)<br>(one-off) | Collaboration with<br>International Smart<br>Grid Action Network<br>(ISGAN) | Proposed pilot project<br>(probably in conjunction with<br>Smart Grid project).  |
| Smart grid                                       | New project                                       | RM50mil (pilot<br>project)<br>(one-off)                    | Collaboration with<br>ISGAN   | Proposed pilot project.  |
| Green grid (Sabah)                               | Ongoing   | RM350mil<br>(one-off)                                      | None  | Green grid to connect potential<br>biogas and biomass plants to<br>rural communities remote from<br>the grid in Sabah.   |

Apart from financing and technology constraints, the development of renewable energy requires a coherent policy and institutional framework governing the energy sector as a whole. Streamlining of the energyrelated institutional framework and addressing energy resource utilisation from primary energy to transformation and final energy use remain the biggest challenge for the energy sector. This needs to be addressed holistically to promote renewable energy as a mainstream energy source.

### 5.3.3 Energy Efficiency

Past plans to implement energy efficiency have delivered limited results due to limited financial resources and capacity. Moving forward, the proposed National Energy Efficiency Action Plan (NEEAP) (2016-2025), which is in the final stages of development, builds on the experiences and lessons learnt from past energy efficiency programmes. Key initiatives would include energy performance standards, promotion of energy-efficient appliances, energy audits and management in buildings, industries and energy-efficient building design.

Limited financial resources compounded by the high cost of related technologies are key barriers to widespread implementation and sustainability of energy efficiency programmes. Retrofitting of Government buildings with energy-efficient systems can only be carried out on a limited basis. In the industrial sector, slow penetration of the practice of energy auditing requires priority action. This would be addressed by one of the key initiatives of the NEEAP.

### 5.3.4 Waste

Coordination among relevant local, state and federal agencies in the waste sector is a key requisite for effective waste management. Efforts are also required to obtain a better understanding of waste composition and to enable the development of a holistic strategy plan for the management of industrial, commercial and residential waste. The National Strategic Plan for Solid Waste Management formulated in 2005 for the period up to 2020 only targets municipal solid waste in Peninsular Malaysia. The legislation that governs solid waste management is restricted by the constitutional arrangements between Peninsular Malaysia, Sabah and Sarawak. As a consequence, the Solid Waste and Public Cleansing Management Act enacted in 2007, is applicable only to Peninsular Malaysia and the Federal Territories of Putrajaya and Labuan. As of August 2015, the legislation has only been adopted by six States and two Federal Territories in Peninsular Malaysia. Moving forward, the Eleventh Malaysia Plan calls for the establishment of a national committee on sustainable waste management to enhance coordination nationally.

The National Strategic Plan for Solid Waste Management has set a target of 22% for household waste recycling by 2020. However the lack of coordination among agencies involved in waste management has affected the effective implementation of the 3R (reuse, reduce and recycle) programme. Apart from enhancing coordination, awareness and education programmes will be continued under the Eleventh Malaysia Plan to inculcate better consumption and waste disposal behaviour. The Eleventh Malaysia Plan also envisions waste recycling and recovery of waste to reduce dependency on natural resources or, as appropriate, as a viable energy resource. This can help to reduce greenhouse gas emissions from the waste sector.

Accurate quantification of greenhouse gas emissions from the waste sector remains a challenge due to lack of proper assessment tools and skills. As a consequence, although several local Government-led efforts to reduce emission levels from the waste sector through enhanced recycling and composting have been implemented, the impacts of these initiatives have not been quantified.

# 5.3.5 Land Use, Land-Use Change and Forestry

Malaysia has taken significant efforts to maintain at least 50% forest cover. However, the aspiration is being challenged by socioeconomic development needs. The country continues to face threats of forest degradation as economic valuation of the ecosystem services provided by forests remains largely invisible and undervalued. Population growth, resulting in demand for housing and infrastructure, is also putting a considerable strain on land-use patterns.

Sustainable forest management began in the 1970s with the introduction of the selective management system. This initiative was followed by project-based forest certification systems implemented since the mid-1990s in Peninsular Malaysia and Sabah, and is being expanded to cover Sarawak. This would help ensure that more forest concessions are being managed with sustainable logging practices and certified by the Malaysian Timber Certification Scheme or the Forest Stewardship Council. Harmonisation of the forest management system will be strengthened further with the alignment of the National Forestry Inventory by 2022 among Peninsular Malaysia, Sabah and Sarawak. This is expected to enhance the management of forest cover and its importance as a carbon sink.

Land-use change affecting peat-lands and associated peat fires have been a considerable challenge over the last two decades. Efforts to reduce the emissions due to peat subsidence and fires on peat soil would require restoring the water table, replanting the degraded forests and putting in place effective fire monitoring systems. Towards this end, the Government in the Tenth Malaysia Plan has invested in 137 check dams, 40 water tube wells and three watch towers in hot spot areas to address peatland fires.

Further, to ensure that Malaysia maintains at least 50% of its forest cover, the UNFCCC

REDD+ mechanism is regarded as a viable incentive for sub-national entities to maintain their existing forest cover. Towards this end, the Federal Government has submitted its Forest Reference Level (FRL) for REDD+ results-based payments in December 2014 to the UNFCCC Secretariat. The inclusion of the submission in Technical Annex 2 is voluntary and exclusively for the purpose of obtaining and receiving payments for REDD+ actions, pursuant to paragraph 2 of Decision 13/CP.19 and paragraphs 7 and 8 of Decision 14/CP.19.

# 5.3.6 Transportation

Energy consumption in the transportation sector has grown significantly with the rapid rise in motor vehicle ownership in the last two decades, from 4.7 million in 1990 to 20.1 million in 2010 which has increased further to 23.8 million in 2013. Development of an efficient and integrated public transportation system, covering the densely populated areas and accessible to the first- and last-mile, is crucial to reverse this trend. This requires integrated long-term urban planning.

# 5.3.6.1 Urban Transportation

In the Greater Kuala Lumpur region, the promotion of an efficient public transportation system has thus far focussed largely on mass rail connection. To further improve accessibility and connectivity, the bus rapid transit network identified in the Greater Kuala Lumpur/Klang Valley Public Transport Master Plan needs to be developed concurrently. Financial constraints pose a challenge to expand the network and to replicate similar public transportation systems in other rapidly growing cities that are facing an increase in traffic congestion and pollution problems from high private vehicle ownership.

As the public transport system develops, the mind-set of the people also needs to be cultivated to move away from private vehicle ownership to the use of public transportation.

# 5.3.6.2 Inter-City Connectivity

Reduction of private vehicle usage for inter-city travel can be realised with better inter-city rail connection. This includes the proposed High Speed Rail System connecting Kuala Lumpur to Singapore in the south and the extension of the double-tracking system from Seremban in Negeri Sembilan to Perlis in the north. Cost constraints and optimal ridership are barriers towards further expansion to the east coast of Peninsular Malaysia and development of such inter-city rail connection in the states of Sabah and Sarawak.

#### 5.3.6.3 Biodiesel Compatibility

The plan by the Government to progressively move towards higher composition of palm oil biofuel in biodiesel blends (higher than B7) for vehicle fuel usage is faced with technology compatibility challenges for certain vehicle engine models. This would require further collaborative testing and refinement with the automotive industry and the willingness to develop engine models that are compatible with the higher palm oil biodiesel fuel mixes.

# 5.3.7 Promotion of Green Technology

Fiscal instruments to help the private sector's transition to low-carbon operations through the Green Technology Financing Scheme (GTFS) that was launched in 2009 have faced considerable challenges. The conservative approach of commercial banks perceived this instrument as risky despite the Government's absorption of 2% of the interest rates and guaranteeing of up to 60% of the loan amount.

#### 5.4 Vulnerability and Adaptation

As Malaysia strives to develop in a sustainable manner, the increase in vulnerabilities arising from the impacts of climate change poses additional challenges which could partially negate the development and mitigation gains which the country has achieved thus far. As such, the issue of vulnerability and adaptation is seen as a critical area for Malaysia to communicate in its Biennial Update Report. Past development efforts that have provided early adaptation benefits to the country have been largely carried out on a sectoral basis in response to specific needs. In light of the increasing threats of climate change and in order to be able to plan holistically and in advance, adaptation efforts will therefore need to be considerably scaled up via a comprehensive and proactive national adaptation plan. Under the Eleventh Malaysia Plan, two key adaptationrelated initiatives, namely enhancing adaptation measures through the development of a national adaptation plan and strengthening disaster risk management will be undertaken to increase the nation's resilience to the impacts of climate change and natural disasters. These efforts will further mainstream climate change adaptation planning into national development plans and activities.

Adequate technical and financial support is necessary to ensure that adaptation measures are effective and sustainable. Towards this end, Malaysia is also anticipating financial, technical and capacity building support from the international community in the development and implementation of its national adaptation plan.

# 5.4.1 Climate Projection and Sea-Level-Rise Modelling

High-resolution climate change projection scenarios are essential for climate change impact, vulnerability and risk assessment studies at local scales. Since NC2, efforts have been taken to raise the competency level of personnel involved in climate change modelling through extensive training and involvement in collaborative projects with international experts. Through these efforts, the horizontal resolution of climate modelling projection data has improved from 9 km to 6 km. However, capacity is needed in interpreting these data information for adaptation assessment and application in the various sectors.

Detailed sea-level-rise studies have only been conducted at some of the vulnerable coastal

areas. These studies utilised local coastal observation data, satellite data and projections from global climate models to project future vulnerabilities in a 20-year sequence from 2020 to 2100. In addition, research is also needed to better understand and project the interactions between sea-level rise and weather extremes over coastal areas.

# 5.4.2 Water and Coastal Resources Management

# 5.4.2.1 Flood Mitigation

The major climate variability impacts that Malaysia faces on a yearly basis are floods and occasional droughts that affect certain areas of the country. With increasing weather extremes, flood mitigation plans are being reassessed to provide more effective responses. As a country with a long coastline, this also requires that adequate attention be placed on the interface between river drainage capacities, sea level rise and stronger storm surges as well as integrity of natural ecosystems.

Flood mitigation programmes have been recurring features of Government expenditure for many decades. During the Tenth Malaysia Plan (2011–2015), 194 flood mitigation projects were implemented and 34 local scale flood hazard maps were developed to facilitate disaster prevention implementation. Despite these cumulative efforts, the country is still prone to extreme weather events. In the extreme flood of 2014, 25 lives were lost, half a million people were affected and damage to public infrastructure amounted to RM2.9 billion.

The average cost borne by the Government to mitigate floods over the past 40 years has risen from about RM3 million per year during the Second Malaysia Plan period (1971-1975) to RM1.3 billion per year during the Tenth Malaysia Plan period (2011-2015).

As part of the efforts to implement integrated flood management (IFM), integrated flood forecasting and early warning systems (EWS) incorporating public participation have been developed for several major river basins. Nevertheless, the coverage needs to be expanded to all river basins, taking into account the role of forests in IFM. To improve the accuracy, lead time and effectiveness of EWS, further refinement of the systems through technology transfer, in particular the numerical weather and flood prediction components, is necessary. To meet the additional human resource needs for IFM, training programmes in IFM, including EWS, will be required.

# 5.4.2.2 Water Resource Management

As 97% of the water supply in Malaysia is derived from surface water in rivers and reservoirs, management of these vital water catchment areas is crucial to ensure a reliable source of water supply. Increasingly unpredictable climatic conditions, including more extreme dry and wet seasons, abnormally distributed and higher rainfall intensity, unpredictable droughts, increased sedimentation of rivers and rainfall-associated landslides further complicate efforts to develop a sound water management regime.

Apart from the climate-induced constraints, the Federated governance system, which accords management of forests and water resources to the States, continues to pose a challenge in the implementation of comprehensive policy and legislation at the State level in support of the National Water Resources Policy and its component Integrated Water Resource Management, Integrated River Basin Management and Integrated Flood Management plans.

To ensure adequate and safe water supplies, inter-basin water transfer projects are being implemented to supply water to areas that are experiencing water stress due to high economic and population growth and spatial and temporal shifts in rainfall distribution. Although expensive, these multi-billion Ringgit infrastructure investments are necessary to address water resource needs under a future climate regime. Additionally for urban areas, the feasibility of large-scale rainwater harvesting and utilisation system is being assessed.

Therefore, demand-side management such as minimising loss of non-revenue water, water tariff restructuring along with public awareness building to encourage water conservation needs to be pursued aggressively. Water saving technologies and assessment of the viability of alternative water resources would further require sound technology assistance. Additional funding for research and development in water saving techniques and improving water quality is also needed.

# 5.4.2.3 Coastal Management

Studies have also been conducted on the impacts of sea-level rise in several coastal localities, including the impacts on groundwater and saline intrusion. However the socioeconomic impact has not been assessed. Transfer of the latest modelling capabilities related to sea-level rise is needed in order to be able to obtain more accurate projections. This will enable better analysis of the related effects and the formulation of appropriate adaptation measures.

# 5.4.3 Infrastructure

Existing essential infrastructure such as roads, railways, seaports and airports, public amenities and private properties are currently constructed without factoring in the impacts of climate change such as increase in weather extremes, sea-level rise and more warm days. Responding and adapting to the impacts of the increase in frequency and severity of weather extremes would need considerable capital investments. The increase in warmer weather also increases the challenges of reducing energy consumption for cooling purposes.

In the coastal areas, expanding population, increase of tourism facilities, reliance on seaports for Malaysia's export-oriented economy and coastal food production areas have amplified the country's vulnerability to sea-level rise, storm surges and associated shoreline erosion. These areas need to increase their resilience and adaptive capacity to increases in extreme weather patterns and sea-level rise.

Other public infrastructure such as power plants, water treatment plants, sewerage systems and municipal waste landfills are becoming more vulnerable with increase in extreme flooding events. Electricity generation and distribution facilities are vulnerable to a myriad of climate change effects. To protect these facilities, significant additional investments are required from the Government and the private sector to ensure continued service.

To prevent disasters from occurring, a comprehensive assessment of the integrity of dams and other hydraulic structures with climate change impacts factored in is necessary. A robust monitoring and detection system on the integrity of these water related structures is also needed.

With rising temperatures, the heat island effects experienced by most cities are expected to worsen. Achieving thermal comfort, particularly in residential buildings, will be a huge challenge to energy conservation and emissions reduction efforts. Aside from the need to ensure thermal comfort of the people, the durability of conventional building materials could be shortened by excessive heat and would require the future use of stronger and adaptive materials. Research on the effects of temperature rise on building materials and incentives to promote the development of durable and less heat-absorbing materials for the construction industry should be considered, if ongoing research determines these to be a necessity to ensure long-term savings and safety of buildings.

# 5.4.4 Agriculture

Agriculture production faces high risks with changing climatic conditions. The yields of

important crops such as rice, vegetables, cocoa, oil palm and rubber are susceptible to extreme weather patterns during their varying stages of growth. This in turn jeopardises the country's quest to minimise its food imports and enhance food security. Crop modelling activities need to be enhanced in order to predict the impact of climate change on crop yields and farmers' income. It would also be crucial to intensify research into pest and diseases, in anticipation of changing patterns of such incidences dues to climate change.

Crop modelling simulations for paddy show that a temperature increase of 2°C above the threshold temperature will reduce yields by as much as 13%, while floods and droughts during the early stage of the growing season could decrease yields by as much as 80%. Established rice varieties such as MR219 and MR232, which were developed to be cultivated under existing weather conditions may no longer be viable in the near future. In rice farming, research to develop additional rice varieties which are tolerant to floods, drought and extreme temperatures has been initiated. Water-saving aerobic rice farming has been developed and will be gradually implemented nationwide. Simulation studies on shifting planting dates are ongoing.

In addition, breeding programmes for heatand water-efficient varieties of oil palm and cocoa are being conducted. The use of the Low Intensity Tapping System and of rain gutters in rubber plantations has been also introduced but deployment of these techniques would require substantial efforts to impart the skills to the workforce in this labour-intensive industry. Smallholders and farmers are slow to adopt good agriculture practices such as water and fertiliser management that could help their farms adapt to the changing climate. It is therefore imperative that serious efforts are made in Malaysia to ensure that the agriculture sector can adapt to climate change and be resilient. The Eleventh Malaysia Plan recognises that strengthening the resilience of the agriculture

sector would require greater implementation of good agricultural practices as well as intensifying research and development, especially in agriculture climate-modelling and expansion of good agricultural practices. The strengthening of institutional support and extension services, including training extension officers in managing anticipated climate change impacts, would also be important.

# 5.4.5 Forestry and Biodiversity

Malaysia is one of most mega-diverse countries in the world. The beneficial role played by forests such as the protection of soil and water resources, conservation of biological diversity, fulfilling aesthetic and recreational needs, regulation of the climate system, and sequestration of atmospheric carbon, most of which have a direct or indirect role in reducing vulnerabilities to climate change, is recognised. However, this rich biological diversity is increasingly under pressure and seriously threatened. The impacts of climate change are expected to affect ecosystem function and further exacerbate biodiversity loss.

However, data and information on the impacts of climate change on both terrestrial and aquatic ecosystems and the species in these spaces remain low due to a lack of research. This has affected the formulation of effective adaptation strategies to build the resilience of ecosystems.

Research on the impacts of climate change on tree phenology, growth rate, carbon fluxes, floristic composition, and so on, is likewise constrained by the lack of modelling tools, comprehensive monitoring and technical capacity. Indicator plots of various forest types should be established to monitor climate change impacts. Climate stations in long-term research plots such as Pasoh and Lambir as well as Danum Valley are well placed to carry out more such research and could be expanded to cover the different forest types. Technical capacities are also urgently needed to analyse the potential impacts of sea-level rise, sea- and land-temperature rise and precipitation variability on vulnerable habitats, as well as on flora and fauna species, to better inform adaptation planning.

The lack of adequate and sustained financing sources for existing ecosystem protection plans is hampering the progress of conservation efforts to connect vital forest corridors, such as the Central Forest Spine in Peninsular Malaysia, and the Heart of Borneo project in Sabah and Sarawak. Similarly, funds are lacking for the establishment of marine protected areas and to ensure the optimal functions of exsitu conservation programmes for threatened plants and animals, such as seed banks and captive breeding centres, respectively.

# 5.4.6 Public Health

Vector-borne diseases such as dengue and malaria are expected to be further exacerbated by rising temperatures and high rainfall. The dengue menace in urban centres has been a constant public health challenge affecting a wide population of all age groups in Malaysia and this is expected to worsen with the impacts of climate change.

The control and prevention of dengue transmission using early test kits and community behavioural intervention as well as exploratory research on alternative medicines are among the efforts being undertaken. An integrated approach to suppressing the mosquito vector population that involves targeted research and high public awareness and participation, while crucial, is still insufficiently implemented. Research on the relationship between dengue transmission and climate change is still in its infancy and will need to be stepped up substantially in order to better understand and manage the effects of climate change.

Malaria is largely confined to the forested interior regions of Malaysia. Nevertheless, constant monitoring of outbreaks is being carried out by rural health services to prevent any geographical spread.

Climate-related disasters are already posing huge challenges to the public disaster management systems. Ensuring clean water supply and optimal sewerage services are particularly difficult during disasters such as flooding, as experienced during the recent year-end massive flooding that affected several states, giving rise to food and waterborne diseases. As extreme weather events are expected to become more frequent, preparedness is needed in addressing public health issues during and after such natural disasters, to ensure that isolated disease events do not escalate into outbreaks.

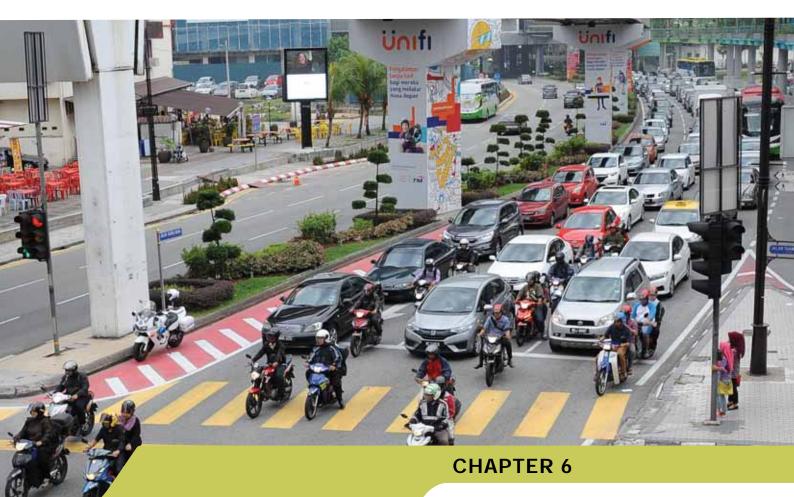

A significant proportion of the workforce in Malaysia is engaged in outdoor economic activities that are exposed to heat, in both the urban and rural areas. While there has been no incidence of heat-related health issues among the populace, the threat of heat waves has been considered an area for early institutional preparation. Development of specific guidelines and standard operating procedures at primary and tertiary healthcare facilities to deal with heat-related ailments need to be implemented in the near term.

# 5.5 Research and Systematic Observation

There is insufficient systematic monitoring of climate change in Malaysia. Funding for data collection and basic climate change research has been limited due to competing needs and consequently there is a lack of national capacity for these activities. As such, the necessary information and data references that would strengthen the national climate change response are lacking.

Given the large uncertainties in projecting the impacts of climate change in Malaysia, there is an urgent need to improve climate modelling work including through regional downscaling to enhance vulnerability assessment and adaptation policy development. A multidisciplinary approach to understand the impacts and identify priority research areas has yet to be carried out for key sectors, particularly water resources, energy, health, food production, economic activities and natural resource protection. These steps are necessary to improve science-based policy interventions and would require developing and enhancing local expertise and transfer of skills and knowledge from international institutions.

The further development of multidisciplinary research and networks of long-term ecological research sites in the forestry sector, marine and other ecological areas is needed to study the interactions of biodiversity, hydrology, carbon fluxes and carbon sequestration with the changing climate. These steps are vital to protect natural carbon sinks and to understand the impacts of climate change on them as well as the extent of services they provide in regulating micro-climates and creating resilience and protecting against the impacts of a changing climate. Furthermore, there is an urgent need to study the linkages and synergies of efforts in mitigation, adaptation, disaster risk reduction as well as to analyse and quantify loss and damage from the impacts of climate change.

# OTHER INFORMATION ON ADDRESSING CLIMATE CHANGE

# CHAPTER 6: OTHER INFORMATION ON ADDRESSING CLIMATE CHANGE

#### 6.1 Introduction

This chapter provides information on several cross-cutting and other initiatives that are also addressing climate change. These are in addition to the policies and initiatives that are described in Chapter 3.

#### 6.2 National Physical Plan

Malaysia's Second National Physical Plan (2010-2020) provides a long-term strategic framework for national spatial planning and includes measures required to shape the direction and pattern of land use, biodiversity conservation and development in Peninsular Malaysia. It is a set of guidelines for the Federal and State governments to control development and land administration.

# 6.3 Cities

To further promote sustainable urban development, the National Urbanization Policy 2006 set out clear policies for city development with key objectives including the development of a high-capacity public transport system and implementation of sustainable solid waste management systems.

#### 6.3.1 Low Carbon Cities Framework

The framework of low-carbon or green cities that has been adopted in Malaysia provides an overarching and cross-cutting approach to climate action. The National Green Technology Policy was launched in 2009. One of its social indicators is that there "should be more cities, townships and communities in Malaysia embracing green technology and which are classified as green townships". Subsequently, the Ministry of Energy, Green Technology and Water developed the Low Carbon Cities Framework (LCCF) to guide the implementation of carbon reduction measures in cities and townships. The framework is complemented by an assessment system which allows for the implementation of such measures to be quantified and monitored.

The LCCF attempts to bridge the gap between existing policies and the many building rating tools currently available in the market. By focussing specifically on strategies and measures towards carbon reduction, it aims to help stakeholders in cities and townships define their priorities and develop action plans to reduce their carbon emissions. The LCCF aims to:

- Create awareness, encourage and promote the concept of green cities in Malaysia;
- Guide city administrators in decisionmaking towards green solutions for cities and townships;
- Enable cities and townships to measure their current and baseline carbon emissions; and
- Enable cities and townships to define their carbon strategies and subsequently measure the performance of their action.

The LCCF aims to assist users in assessing green practices in cities and townships, and to increase understanding of the design and development of green townships. The goal is developing cities which are continuously reducing carbon emissions and ultimately becoming zero or neutral carbon cities.

The four main urban focus areas are environment, transport, infrastructure and buildings. The assessment system allows the user to calculate the baseline and the reduced carbon emissions. This then translates into a carbon reduction rating for any particular development.

# 6.3.2 Other Initiatives

The Ministry of Housing and Local Government has also formulated and undertaken strategies, programmes, projects and initiatives to encourage more sustainable cities. For example, it formulated the Guidelines for Green Neighbourhoods in 2011. The Department of Town and Country Planning has established the Malaysian Urban Indicator Network (MURNInets) for use as a tool to monitor the quality and achievement of cities and towns in terms of their sustainability.

The Eleventh Malaysia Plan complements these efforts by proposing to develop city competitiveness master plans for four major cities, namely Kuala Lumpur, Johor Bahru, Kuching and Kota Kinabalu. The principles of the master plans include expanding transitoriented development to increase use of public transportation and reduce reliance on private vehicles, encouraging greenbased development and practices, and optimising resource use. Environmentally friendly practices such as green buildings, green lifestyles, sustainable consumption and production, and efficient waste management are to be embedded within the development plans of these cities.

Several municipal and city councils in Malaysia are also part of the ICLEI - Local Governments for Sustainability network, which aims to support and encourage cities to become more sustainable and to have a lower carbon footprint. Similarly, two local councils have taken part in the WWF Earth Hour City Challenge, a competition among cities to promote renewable energy and prepare for climate change. The cities that participate in this voluntary programme are recognised for their efforts in trying to create more sustainable, resilient cities. Additionally, Local Agenda 21 implementation by some Malaysian cities has resulted in self-initiated strategic endeavours to promote eco-mobility, energy management, environmental education, green-community consciousness, carbon footprint assessment and green technology, amongst others.

Two examples highlighted below – Melaka and Iskandar Malaysia – showcase the efforts undertaken by regional authorities to promote and operationalise low-carbon cities.

# 6.4 Government Green Procurement and Green Labelling

Government Green Procurement (GGP) is an existing initiative undertaken by the Ministry of Finance and the Ministry of Energy, Green Technology and Water. GGP will be expanded and implemented by all Government ministries and agencies during the Eleventh Malaysia Plan.

GGP is expected to support a switch to more sustainable procurement practices, with

#### Box 1: Melaka

The Melaka State Government aims to become the country's first green technology city or 'Green' State by 2020. To achieve this aim, Melaka has put in place institutional arrangements, such as the Melaka Green Technology Council to oversee the planning and monitoring of green technology developments in the state in 2011, and the Melaka Green Technology Corporation in 2013.

In 2011, the Melaka Green Technology City State Blueprint (2011-2020) was produced and in 2014, the Melaka Green City Action Plan was developed to further enhance the planning for green development in Melaka.

All local councils have been instructed to set up Green Technology Action Committees, which report to the Melaka State Green Technology Council. The Council is chaired by the Chief Minister of Melaka and comprises State Executive Committee members, local councilors, and related government agencies.

The Melaka Green Technology Corporation functions as the secretariat for the Melaka Green Technology Council. It aims to lead green development initiatives, implement green policies, plan and monitor green technology development, and enhance businesses and investment in green technology in the state.

Various green technology projects and programmes are already being implemented or are planned. These include various solar projects, such as the Melaka World Solar Valley to catalyse the solar industry, a pioneer green city (Hang Tuah Jaya Green City), Melaka River Rehabilitation Project, electric buses and car-charging stations, biodiesel programme, green building ratings and retrofitting, recycling and waste programmes.

#### Box 2: Iskandar Malaysia

Iskandar Malaysia was established in 2006 as a part of the Southern Economic Corridor under the Ninth Malaysia Plan. It is administered by the Iskandar Regional Development Authority (IRDA), which is a Federal Government statutory body. The development region has a population of around 1.6 million (in 2010) people across five local planning authorities.

IRDA has adopted and applied the Low Carbon Society (LCS) framework. Its objectives are to draw up key policies and strategies to guide the development of Iskandar Malaysia in mitigating carbon emissions, in order to transform the region into a sustainable low-carbon metropolis by adopting green-growth strategies; and to respond to the nation's aspiration for ensuring climate-resilient development for sustainability.

The LCS Blueprint for Iskandar Malaysia 2025 was launched in 2013 to promote low-carbon development and provide the policy framework and supporting technical tools. It outlines 12 actions to reduce carbon emissions, grouped around three themes: Green Environment, Green Economy and Green Community. The 12 actions are: integrated green transportation; green industry; low-carbon urban governance; green buildings and construction; green-energy systems and renewable energy; low-carbon lifestyle; community engagement and consensus building; walkable, safe, liveable city design; smart growth; green and blue infrastructure and rural resources; sustainable waste management; and clean air environment.

Government leading by example. It is envisaged to create the demand for green products and services, such as those produced with or using lower energy consumption. By 2020, the target is for at least 20% of Government procurement to be green.

The efforts to implement further GGP are expected to complement the existing labelling scheme for the certification of green products and services. Under the Eleventh Malaysia Plan, the *MyHijau Mark* programme will be expanded for key product areas such as household products, electronic and electrical appliances. Green rating systems and standards, aligned with international best practices, will also be introduced to promote the greening of industries.

# 6.5 Carbon and Environmental Reporting

The National Corporate Greenhouse Gas (GHG) Reporting Programme for Malaysia (also known as MyCarbon) is a voluntary reporting mechanism that was launched in December 2013. Its main objective is to establish the framework to support reporting of GHG emissions by the corporate sector in a standardised and internationally recognised manner. By doing so, the programme aims to encourage and facilitate private entities to measure and report their greenhouse gas emissions, from which they can identify actions to reduce emissions. As of January 2015, 26 companies have volunteered to participate in the programme. As an incentive to encourage more companies to participate in the MyCarbon Programme, a tax deduction incentive on the expenses incurred by the participating companies for the preparation of their GHG reports for the period 1 January 2015 to 31 December 2016, has been approved by the Ministry of Finance.

In 2014, Bursa Malaysia launched an Environmental, Social and Governance (ESG)

Index. The FTSE4Good Bursa Malaysia (F4GBM) Index was developed in collaboration with the Financial Times Stock Exchange (FTSE) as part of the globally benchmarked FTSE4Good Index Series and was aligned with other leading global ESG frameworks such as the Global Reporting Initiative and the Carbon Disclosure Project. The F4GBM Index will be used to measure the performance of companies demonstrating strong ESG practices. Constituents of the new index must meet internationally benchmarked criteria that measure efforts in environmental conservation, the impact of social responsibility initiatives on the community and the practice of good governance through responsible and ethical decision-making.

# 6.6 Conclusion

Malaysia intends to continue to pursue sustainable development with the aim of achieving emissions reduction, along with the protection of its vital natural resources to build its resilience to the impacts of climate change. While it has been doing so thus far largely with public funding, additional and timely international assistance in the forms of financing, technology transfer and capacity building, in accordance with the principles and provisions of the UNFCCC, would help shift Malaysia on its path towards low-carbon economic development more quickly and more substantially.

While concrete efforts have been undertaken thus far, real challenges remain in ensuring policy coherence, particularly given several competing needs and priorities for the nation. There is also an urgent need for better coordination across the various Federal Ministries and agencies, given the crosscutting nature of climate change. In addition, proper implementation of the policies in order to yield concrete results remains a substantial challenge.

# Appendix 1: Key Data for 2011 (Malaysia)

| Latitude <sup>a</sup>                                   | 0° 51′ N - 7° 33′ N            |
|---|--------------------------------|
| Longitude <sup>a</sup>                                  | 98° 01' E - 119° 30' E         |
| Area  | 330,183 km <sup>2</sup>        |
| Coastline   | 5,267 km                       |
| Mean daily temperature                                  | 26-28°C                        |
| Average annual rainfall                                 | 2,000-4,000 mm                 |
| Average daily direct sunlight                           | 6 hours                        |
| Forest Cover as % of total land area                    | 54.3%                          |
| Population  | 29.1 million                   |
| Population density                                      | 88 per km <sup>2</sup>         |
| Female life expectancy                                  | 76.90 years                    |
| Male life expectancy                                    | 72.16 years                    |
| GDP   | RM711,800 million <sup>b</sup> |
| GNI/capita  | RM 22,961 <sup>b</sup>         |
| Primary Energy Supply                                   | 79,289 ktoe                    |
| Energy Demand   | 43,456 ktoe                    |
| Length of roads (Federal and State)                     | 155, 427 km                    |
| Motor vehicle registration                              | 21.4 million                   |
| Ridership on urban rail network (passenger journeys)    | 183.3 million                  |
| Oil Palm  | 5,000,110 ha                   |
| Rubber  | 1,027,040 ha                   |
| Paddy (Planted Area)                                    | 687,940 ha                     |
| Cattle  | 768,710                        |
| Swine   | 1,816,557                      |
| Poultry   | 238,361,891                    |
| Marine Fish Landings                                    | 1,373,000 tonnes               |
| Aquaculture Production                                  | 526,000 tonnes                 |
| Solid Waste<br><sup>a</sup> Includes territorial waters | 33,130 tonnes/day (2012)       |

<sup>b</sup>2005 constant prices

| Thematic Area | Constraint/Gap  | Recommendations  |
|---------------|---|--|
|               | Limited technical capacity in applying national activity data and proxy data to generate the required data for GHG inventory. | Accelerate capacity building to increase the pool and capability of GHG inventory compilers and data providers.  |
|               | Lack of historical data, particularly for the waste and industrial processes sectors.   | Enhance collection of identified missing historical activity data from key sectors to meet IPCC requirements.  |
|               | data sets reported in national and ensure   | A centralised data collection and compilation mechanism to<br>ensure the quality, consistency and reliability of inventories is<br>being developed.  |
| GHG Inventory | Not all sectors were covered to satisfaction due to technical and data gaps.  | Subsectors identified in the GHG Inventory improvement plan<br>as "not yet reported" will be explored for future inclusion.<br>Increase cooperation with data providers especially from the<br>private sector to collate data for additional subsectors. |
|               | Difficulties in moving to higher tiers<br>due to lack of detailed local data<br>and emission factors.                         | Increase collaboration and cooperation with data providers to improve data disaggregation.<br>Enhance research and development of local emission factors.  |
|               | Limited technical capacity<br>in carrying out uncertainty<br>assessments.   | Continuous capacity building through participation in national and regional workshops.   |

# Appendix 2: Summary of Constraints, Gaps and Recommendations

| Thematic Area | Constraint/Gap  | Recommendations  |
|---------------|---|--|
|               | Limited funding constrains wider<br>deployment of RE through the FiT<br>mechanism.  | Enhance access to international financial assistance, capacity development and technology transfer to accelerate RE deployment.<br>Accelerate solar PV technology transfer to further reduce cost of RE.   |
|               | Limited financial resources and<br>capacity are the barriers to develop<br>and execute a sound and holistic<br>energy efficiency plan.  | National Energy Efficiency Action Plan (NEEAP) (2016-2025)<br>in the final stages of development. NEEAP key initiatives<br>include energy performance standards, promotion of energy-<br>efficient appliances, energy audits and management, and<br>energy-efficient buildings.  |
|               | Lack of coordination among relevant<br>local, state, federal agencies<br>for waste management due to<br>restricted applicability of legislation<br>in certain States.                             | A national committee on sustainable waste management<br>to enhance coordination nationally is proposed under the<br>Eleventh Malaysia Plan.  |
|               | Lack of effective coordination has<br>affected the implementation of the<br>3R (reuse, reduce and recycle)<br>programme.  | Enhance awareness/education programmes to inculcate better consumption, waste disposal behaviour and coordination.<br>Promote waste recycling and recovery to reduce dependency on natural resources or, as appropriate, as a viable energy resource.  |
|               | Lack of proper assessment tools<br>and skills to enable accurate<br>quantification of GHG emissions.  | Develop tools and capacity to use them.  |
| Mitigation    | Competing socio-economic<br>development puts strain on land use<br>patterns while economic valuation<br>of ecosystem services provided by<br>forests remain largely invisible and<br>undervalued. | <ul><li>REDD+ mechanism regarded as viable incentive for sub-<br/>national entities to maintain forest cover.</li><li>Strengthen sustainable forest management and sustainable<br/>forest certification systems.</li><li>Alignment of National Forestry Inventory by 2022 to enhance<br/>management of forest cover.</li></ul> |
|               | Land use change affecting peat-<br>lands and associated peat fires,<br>resulting in increased emissions.  | Measures include restoring the water table, replanting degraded forests and effective fire monitoring systems.   |
|               | Rapid rise in private vehicle<br>ownership has led to significant<br>growth in energy consumption by<br>the transportation sector.  | Enhance integrated long-term urban planning for the development of an efficient and integrated public transportation system.   |
|               | The promotion of an efficient public transportation system has thus far focussed largely on mass rail connection.   | Develop concurrently the bus rapid transit network as<br>identified in the Greater Kuala Lumpur/Klang Valley Public<br>Transport Master Plan.<br>Develop similar bus rapid transit network for other rapidly<br>growing cities that are facing increase in traffic congestion.   |
|               | Technology compatibility challenges<br>for certain vehicle engine models<br>in using progressively higher<br>composition of palm oil biofuel in<br>biodiesel blends for vehicles.                 | Further collaborative testing and refinement with the automotive industry and development of engine models compatible with higher palm oil biodiesel fuel mixes.   |

# Appendix 2: Summary of Constraints, Gaps and Recommendations (continue)

| Thematic Area      | Constraint/Gap   | Recommendations  |
|--------------------|--|--|
|                    | Approach to adaptation has been<br>largely on a sectoral basis in<br>response to specific needs, leading<br>to lack of holistic and advanced<br>planning for adaptation to climate<br>change.                                  | Scale up adaptation efforts via a comprehensive and proactive national adaptation plan and strengthen disaster risk management.  |
|                    | Lack of capacity in interpreting data<br>from high-resolution climate change<br>projection scenarios for adaptation<br>assessment and application in<br>various sectors.   | Raise competency of climate change modellers through<br>continued and extensive training and involvement in<br>collaborative projects with international experts.  |
|                    | Detailed sea-level rise studies<br>have only been conducted at some<br>vulnerable coastal areas.   | Expand research to other areas, and conduct further research<br>to better understand and project interactions between sea-<br>level rise and weather extremes over coastal areas.  |
|                    | Despite cumulative efforts on flood<br>mitigation, impacts of extreme<br>weather events still take a heavy<br>toll on lives, livelihoods and<br>infrastructure.  | Reassess flood mitigation plans to provide more effective responses.<br>Pay adequate attention to the interface between river drainage capacities, sea-level rise and stronger storm surges.   |
|                    | Implementation of integrated flood<br>management (IFM), integrated<br>flood forecasting and early warning<br>systems (EWS), needs to be<br>expanded to all river basins, taking<br>into account the role of forests in<br>IFM. | Further refinement of the EWS through technology transfer, in particular numerical weather and flood prediction components. Conduct training programmes in IFM, including EWS.   |
| Vulnerability<br>& | Assessment of impacts of sea-level<br>rise, and its impact on groundwater<br>and saline intrusion, taking into<br>consideration socio-economic<br>effects need to be improved.   | Transfer of latest modelling capabilities related to sea-level rise<br>to obtain more accurate projections.<br>Conduct better analysis of the effects and formulation of<br>adaptation measures.   |
| &<br>Adaptation    | Essential infrastructure such as roads, railways, seaports and airports, public amenities and private properties are currently constructed without factoring in the impacts of climate change.                                 | Conduct comprehensive assessment on impacts of climate<br>change on essential infrastructure, in particular integrity of<br>dams and other hydraulic structures.<br>Develop a robust monitoring and detection system.<br>Allocate sufficient resources for the improvements of the |
|                    | Increased challenges of reducing<br>energy consumption for cooling<br>purposes, while durability of<br>conventional building materials<br>could be shortened by excessive<br>heat.   | essential infrastructure including capital investments.<br>Increase research on the effects of temperature rise on<br>durability of building materials and promote development of<br>durable and less heat absorbing materials for the construction<br>industry.                   |
|                    | The yields of crops are susceptible<br>to extreme weather patterns and<br>equilations of the susceptible   | Enhance crop modelling activities to predict impact of climate change on crop yields and farmers' income.  |
|                    | could affect food security.  | Intensify research into pests and diseases, in anticipation of changing patterns due to climate change.  |
|                    |  | Increase research on new crop varieties, in particular for rice<br>and oil palm that are tolerant to floods, droughts and extreme<br>temperatures.   |
|                    |  | Gradually implement water-saving aerobic rice farming nationwide.  |
|                    |  | Continue ongoing simulation studies on shifting planting dates for rice cultivation.   |

# Appendix 2: Summary of Constraints, Gaps and Recommendations (continue)

| Thematic Area                           | Constraint/Gap   | Recommendations  |  |  |  |  |
|---|--|--|--|--|--|--|
|   | Smallholders and farmers slow to<br>adopt good agriculture practices<br>that could help them adapt to climate<br>change.   | Strengthen institutional support and extension services, including training extension officers.  |  |  |  |  |
|   | Limited data and information on<br>impacts of climate change on<br>species and terrestrial and aquatic<br>ecosystems.  | Enhance observation, data collection and long-term research<br>on impacts of climate change on natural ecosystems.   |  |  |  |  |
|   | Lack of technical capacity to analyse<br>impacts of sea level rise, temperature<br>rise and precipitation variability on<br>vulnerable habitats and species.   | Enhance technical capacity to analyse climate change impacts<br>on natural ecosystems.   |  |  |  |  |
|   | Lack of financing for ecosystem<br>protection plans, establishment of<br>marine protected areas and ex-situ<br>conservation programmes.  | Access international funds to complement national funds.   |  |  |  |  |
| Vulnerability<br>&<br>Adaptation        | Integrated approach to suppressing<br>mosquito vectors of dengue<br>involving targeted research and high<br>public awareness and participation<br>is still limited.                                    | Control and prevention of dengue using early test kits and<br>enhance community behavioural intervention.<br>Step up research substantially to better understand and<br>manage the effects of climate change on dengue.<br>Increase research on medication for dengue including research |  |  |  |  |
|   | Malaria is largely confined to the forested interior regions of Malaysia, but needs to be monitored.   | on alternative medicines<br>Constant monitoring of outbreaks by rural health services to<br>prevent geographical spread of malaria.  |  |  |  |  |
|   | Ensuring clean water supply and<br>optimal sewerage services are<br>particularly difficult during disasters<br>such as flooding.   | during and after natural disasters, to ensure that isolated  |  |  |  |  |
|   | The threat of heat-related health issues has not been sufficiently addressed.  |  |  |  |  |  |
|   | Systematic monitoring of climate<br>change and its impacts is insufficient<br>due to limited funding for data<br>collection and basic climate change<br>research, with consequent lack of<br>capacity. | Improve climate modelling including through regional downscaling.<br>Develop and enhance local expertise and transfer skills and knowledge from international institutions.  |  |  |  |  |
| Research &<br>Systematic<br>Observation | Lack of a multidisciplinary approach<br>to understand impacts and identify<br>priority research areas for key<br>sectors.  | Develop multidisciplinary research and networks of long-term<br>ecological research sites to study interactions of biodiversity,<br>hydrology, carbon fluxes and sequestration with climate<br>change.   |  |  |  |  |
|   |  | Study linkages and synergies of efforts in mitigation, adaptation, disaster risk reduction, and analyse and quantify loss and damage.  |  |  |  |  |

Note: Shaded cells do not require entries.

The following standard indicators are used:

NO (not occurring) for activities or processes that do not occur for a particular gas or source/sink category within a country;

 $\ensuremath{\text{NE}}$  (not estimated) for existing emissions and removals which have not been estimated;

NA (not applicable) for activities in a given source/sink category which do not result in emissions or removals of a specific gas.

The following standard indicators are used: NO (not occurring) for activities or processes that do not occur for a particular gas or source/sink category within a country: NE (not estimated) for existing emissions and removals which have not been estimated: NA (not applicable) for activities in a given source/sink category which do not result in emissions or removals of a specific gas; IE (include elsewhere) for emissions and removals estimated but included elsewhere in the inventory.

# TECHNICAL ANNEX 2: SEEKING TO OBTAIN AND RECEIVE PAYMENTS FOR REDD+ RESULTS-BASED ACTIONS (DECISION 14/CP.19)

Following Decisions 13/CP.19, paragraph 2, and 14/CP.19, paragraphs 7 and 8, Malaysia submits the Technical Annex for REDD+ results for the purpose of obtaining and receiving payments. The submission is done on a voluntary basis.

1. Summary information from the final report containing each corresponding assessed forest reference emission level and/or forest reference level, which includes:

Decision 12/CP.17 is recalled where a stepwise approach to the development of national forest reference emission level and/or forest reference level is agreed while noting the importance of adequate and predictable support for the improvement of methodologies and additional pools. Malaysia understands that the forest reference level would include activities, conservation of forest carbon stocks, sustainable management of forests and enhancement of forest carbon stocks while forest reference emission level refers to reducing emissions from deforestation and reducing emissions from forest degradation activities.

Following this understanding, Malaysia's forest reference level addressed the improved forest management post 2005. The improvement includes a cap on cutting limits, implementation of Malaysian criteria and indicators for sustainable forest management.

Malaysia undertook a step wise approach in the improvement of the commercial harvesting protocol and the implementation of reduced impact logging from 1990 to 2003. The maximum harvest limit of 85m<sup>3</sup> is based on the findings from 1990-2003 and the change in forest management. Reducing the cutting limit, affected the income of the State while increasing the cost of forest management. Hence, in the construction of the Forest Reference Level (FRL), Malaysia used historical data from 1992-2010 to capture step-wise improvements and implementation phases. Based on our forest management goal, Malaysia proposes a reference level for sustainable management of forest for result-based payment for REDD+ activity. The Permanent Reserved Forest (PRF) are managed under sustainable forest management principles and remains forested as far as possible and therefore considered in the construction of the FRL. PRF is also degazetted in some cases for gazettement as Totally Protected Areas (TPA). No logging activity is conducted in the Totally Protected Area/Protected Area.

Annual coupe were determined by the respective State Forestry Departments following the forest management used, Malayan Uniform System or Selective Management System for Production forests and monitored at State levels. States are required to provide monthly reports to be validated against the levy and royalty collection. Hence, it is a twoway tracking system from the revenue as well as production side. From 1996 onwards, the National Forestry Council sets and monitors the annual coupe. Degazetted forests may not be subjected to logging or land clearing immediately. PRFs are usually first degazetted into State land forest before being converted to other land or TPA. The commercial harvesting is also monitored through the forest certification where third party auditors would do ground verification. In addition, peer review is also done. The annual reporting of the commercial harvest is verified against these reports.

Reducing the rate of deforestation and degradation is currently being addressed through the Central Forest Spine and Heart of Borneo projects under the Tenth Malaysian Plan. Malaysia may construct a forest reference emission level when deforestation data can be separated from the forest management activities. Additional data and information is being collected from State land Forest.

2. Results in tonnes of  $CO_2$ eq per year, consistent with the assessed forest reference emission level and/or forest reference level.

The results are shown in Table 1 where, the net uptake is minus from the FRL. The total results achieved from sustainable management of forest for period 2006-2010 was -97.47 million tonnes  $CO_2$  against the FRL. These values were included in the forest reference level submission and assessed.

3. Demonstration that the methodologies used to produce the results referred to in paragraph 2 above are consistent with those used to establish the assessed forest reference emission level and/or forest reference level.

The IPCC 2006 Guidelines were used to calculate the removal by sinks and emissions.

Subtracting the biomass carbon loss from the biomass carbon increment for the reporting year makes the calculation. The forest reference level only considered  $CO_2$  emission while non- $CO_2$  emissions are normally associated with the burning of tree residues or with wild fires are not included. None of these activities are common in the PRF. The carbon pools and greenhouse gas sources considered are shown in Tables 2 and 3.

Tier 1 approach was used where, the dead wood and litter carbon stocks are in equilibrium so that the changes in carbon stock in the dead organic matter pools are assumed to be zero. Likewise, soil carbon stocks do not

change with forest management. The IPCC 2006 Software applies a Tier 1 assumption for litter carbon stocks.

Only sustainably managed forest where commercial harvest is undertaken as part of the management plan is considered, covering a total area of about 12 million ha of forest. The FRL considers all sustainable managed forest and national data, which includes Peninsular Malaysia, Sabah and Sarawak. The Protected Areas/Totally Protected Areas were not considered because no logging activities are carried out in these areas.

Historical emission estimates are developed based on official statistics on the commercial harvest of logs from PRF. 1990 was used as the time of the FRL historic period because of a series of improvements in forest management started from 1978 onwards. Hence, time series from 1992-2010 was used to generate the reference level. The baseline is recalculated every 5 years, for period 2006-2010, historic emissions from 1992-2005; and 2011-2015, historic emission from 1997-2010 respectively. Emission factors were generated from the National Forest Inventory (NFI), growth and yield plots and publications. The Fourth and Fifth NFI design is described as a stratified satellite based on randomly distributed permanent sample units. The sampling design consists of permanent sample units (satellites) of square shape with one sample plot in each corner. Each sample plot consists of a sample circle for small size trees and a point sample. Each sample unit consists of four (4) sample plots and three (3) sample strips. Each sample plot is a combination of a fixed sample circle of 4 m in radius and a point reference. The distance between the sample plot is 100 m. The total sample area is 0.12 hectare. Within the sample circle only commercial trees <10 cm dbh and >1.5 m in height and some key medicinal plants are assessed. The strip sample area is about 0.02 hectare resulting in total sample area at 0.14 hectare. For growth and yield plots, the diameter of all free-standing trees  $\geq$  10 cm diameter at breast height (dbh) was measured at least twice, using standard protocols.

#### Figure 1: Layout of sampling unit

Tree diameter growth was checked for all stems, and outliers were treated. Tree diameter and height was measured for all trees per hectare, using a standardized stratifiedrandom sampling approach whereby trees were randomly selected from four size classes (10-20, 20-30, 30-40 and > 40 cm diameter). The stratification are based on forest type and post logging years. Based on the National Forest Inventory, the biomass increment for forest logged between 1-10 years, 11-20 years and 20-30 years is between 9.2-12 t/ha/yr. However, a significant decline is noted after 30 years to 4.3 t/ha/yr. Hence, Malaysia sets its logging cycle of 25-30 years, based on these figures.

Above-ground biomass (AGB) increments cannot be directly measured but estimated by applying allometric relationships relating stem diameter, height and wood density to AGB. The increment was calculated by comparing the growth difference in AGB. The increment was determined for each diameter class and forest stratification between 2002 and 2012 inventory cycle. For means of comparison, biomass increment was also calculated using the equation presented by Brown (1997), as follows:

#### $Y = 42.69 - 12.8 x(D) + 1.242(D^{2})$ Y= biomass tonne

Biomass density of a strata is estimated using the equation above. Number of trees/ha is obtained from the forest inventories and the mid point of biomass class is determined. Biomass of tree at mid point is determined using the equation above and biomass of all trees is determined by multiplying the number of trees with the biomass of tree at mid point.

For the analyses of individual trees, both diameter growth and above ground biomass were calculated using the census interval that was > 5 year to reduce noise associated with inter-annual differences and that minimized the difference from the median date for all censuses.

For mangrove, Ong and Gong (1993) were used. Allometric techniques, were also used to estimate the mean annual increment based on age of the forest. National studies were undertaken between 2011-2015 to assess the growth of mangroves and the reports are being finalised. The initial reports indicated that the growth rates for mangrove forest are between 10-17 t/ha/yr. The equation is as follows: Y = 0.0277dbh <sup>2.1668</sup>

Mangrove forest had the lowest mortality, at 0.9 percent while inland forest had highest. The total gain by tree growth is subtracted by the mortality. The mortality rates were based on the number of standing dead trees and tree fall.

4. A description of national forest monitoring systems and the institutional roles and responsibilities for measuring, reporting and verifying the results.

Malaysia's National Forest Monitoring System consists of a short and long term monitoring. Biennial geospatial images are used to monitor changes in forest while National Forest Inventory is conducted every ten years.

Forest Monitoring System Using Remote Sensing (FMRS) is a web-based application system using geospatial data generated and remote sensing satellite images. Malaysian Remote Sensing Agency (MRSA) and Forestry Departments have developed the system by inhouse expertise. The objective of the system is to enhance the effectiveness of monitoring of forest resource including logging activities.

FMRS has been operated by the Forestry Departments. The existence of the FMRS online has revolutionized monitoring of forest compared to the periodic ground monitoring, which is often time-consuming, expensive, complicated and difficult to access. The system developed, has changed the monitoring programme to be more focussed, improve the efficiency and effectiveness. In addition, FMRS system can also be used to estimate forest degradation, illegal encroachment in forest area, reducing the need for ground monitoring. FMRS was developed in phases, starting in 2008, where it was first tested in Peninsular Malaysia and is being expanded to Sabah and Sarawak. The system now uses SPOT 5 images from 2009 onwards while LANDSAT was used from 1990-2005.

Additionally ground assessment through NFI is conducted every 10 years once. NFI provides the information on the state and trends of the forest resources, their goods and services, and other related variables that supports monitoring activities in the PRF. Forest Inventories have been conducted in Peninsular Malaysia since 1972 with a variety of objectives and methods. National Forest Inventories are conducted to obtain information on the stands of forest districts to provide information for management decisions. National Forest inventories were aimed at providing data for large scale planning. Due to the geographical composition of Malaysia, different inventory efforts have taken place in Peninsular Malaysia and in the states of Sabah and Sarawak. However, methodologies and objectives have often overlapped. Sabah and Sarawak conducted their forest inventories between 1969-1972 and 1986-1987 respectively. Permanent plots and growth plots have also been established in Sabah and Sarawak and assessments are done periodically. Malaysia will harmonise the National Forest Inventory between the three regions by 2022. Efforts are underway to secure additional funds for forest inventories to be conducted in Sabah and Sarawak.

The NFI has undergone improvement where more forest categories, medicinal plants and biodiversity are included. The NFI records the number of trees following the diameter class, volume, basal area, carbon stocks.

Institutional arrangement for measurement, reporting and verification is shown in Table 4.

|                 | Institution  | Role   |

5. Necessary information that allows for the reconstruction of the results.

Decision 12/CP.17 requires that the forest reference emission levels shall maintain consistency with anthropogenic forest related greenhouse gas emissions by sources and removals by sinks as contained in the country's national greenhouse gas inventory. This implied that the same methodologies and consistent data sets are used to estimate the removal and emissions from sustainable forest management activities in the construction of reference level and in the national greenhouse gas inventory.

Consistent activity data and emission factors have been used throughout the construction of FRL and is consistent with the activity data and emission factors in the national greenhouse gas inventory. Activity data and emission factors used shown in Tables 5, 6 and 7.

| Forest type  | Growth rate                                 | Reference   |
|--|---|---|
| Inland   | 9.3 tdm/ha/yr                               | Fifth NFI and Banin et at (2014)                      |

# ACKNOWLEDGEMENTS

This BUR is based on the contributions, knowledge and expertise of many local scientists, experts and individuals from various government agencies, research organisations, non-governmental organisations, universities and industry organisations. Each sector's Technical Working Group and thematic Sub-Working Groups held meetings and workshops with this wide range of stakeholders who willingly cooperated and contributed. The information was then compile into thematic and sector reports from which most of the information presented in the BUR was extracted. Several meetings and workshops were conducted to finalise the BUR report and reviewers were appointed to consider the entire report before its finalisation.

The invaluable contributions of all the stakeholders are gratefully acknowledged. The contributions from the following lead contributors, agencies and stakeholders are acknowledged.
