UNITED NATIONS FRAMEWORK CONVENTION ON CLIMATE CHANGE

**Subsidiary Body for Scientific and Technological Advice**

**Fortieth session**

**Bonn, 4–15 June 2014**

Item 7 of the provisional agenda

**The 2013–2015 review**

**Subsidiary Body for Implementation**

**Fortieth session**

**Bonn, 4–15 June 2014**

Item 16 of the provisional agenda

**The 2013–2015 review**

**Views on the future work of the structured expert dialogue,  
including the further use of different sources  
of information**

**Submissions from Parties**

**Addendum**

1. In addition to the two submissions from Parties contained in document FCCC/SB/2014/MISC.1, two further submissions from Parties have been received.<sup>1</sup>
2. In accordance with the procedure for miscellaneous documents, these submissions are attached and reproduced\* in the language in which they were received and without formal editing.

---

<sup>1</sup> Also available at <<http://unfccc.int/5901.php>> and <<http://unfccc.int/5902.php>>.

\* These submissions have been electronically imported in order to make them available on electronic systems, including the World Wide Web. The secretariat has made every effort to ensure the correct reproduction of the texts as submitted.

**FCCC/SB/2014/MISC.1/Add.1**

## **China's Submission on the 2013—2015 Review**

In response to paragraph 169 and 170 of FCCC/SBI/2013/20, China would like to submit the following views regarding future work of Structured Expert Dialogue (SED) and how the outcomes of the Review will inform the work of ADP:

### **I. Views on the future work of the SED, including further use of different sources of information**

#### **1. Future work of the SED**

As part of the Review process, the SED shall be guided by the principles and relevant provisions of the Convention and be conducted in full accordance with previous COP decisions and SB conclusions, in particular its mandate and objective set out in Decision 1/CP.18. Building on its previous work, the SED in the future should:

(1) Continue to serve as a platform for exchange of views, information and ideas, with a view to supporting the work of the joint contact group, as defined in paragraph 80 and 85, Decision 1/CP.18, and continue to assist the subsidiary bodies in gathering and compiling information relevant to the Review.

(2) Conduct its work in a balanced manner. The following balances should be maintained throughout the whole process of the SED: the balance between two themes as defined in paragraph 79, Decision 1/CP.18, the balance among three Working Groups of IPCC, the balance among various inputs (including IPCC AR5 reports and other inputs as listed in Decision 2/CP.17, paragraph 161), the balanced participation of experts from developed and developing countries, and the balance among information related to the 6 elements of the 2015 agreement (including mitigation, adaptation, technology, finance, capacity building and transparency).

(3) Organize its work in a transparent and party-driven manner. Parties should be given the opportunity to make comments on the organization of work of the SED. Parties' views and submissions should be taken into full consideration during the preparation for the future SED, and the agenda of the SED should reflect the concerns and proposals from Parties.

(4) Identify and take concrete steps to fill the information gaps with respect to both themes of the Review. Such information gaps shall be addressed by additional inputs and studies (including from experts both from developed countries and developing countries, and from international organizations, regional and national organizations).

(5) Consider initiating discussion on how to assist the subsidiary bodies with the preparation and consideration of the synthesis reports on the Review in accordance with paragraph 86(b), Decision 1/CP.18, with a view to submitting such synthesis report to the subsidiary bodies through the joint contact group no later than at their forty-third sessions (December 2015).

The future SED should address, *inter alia*, the following questions:

Theme 1:

- What is the dangerous climate intervene level and the associated scientific uncertainty?
- What are the impacts of various temperature increase on eco-system, environment, social and economic aspects at global, regional and national level?
- What are the adaptation options, needs, opportunities and costs associated with these impacts?
- What is the mitigation cost associated with various temperature targets?

Theme 2:

- Are the emission reduction commitments of the Parties included in Annex I to the Convention adequate and effective in terms of scientific requirement? What work should be undertaken to assess the implementation of their commitments?
- Are the commitments of Parties included in Annex II to the Convention for the provision of financial resources and the transfer of technology and capacity building to developing countries adequate? Are their commitments implemented effectively? Is there any gap between the needs of developing countries and the commitments of developed countries? If there is a gap, how to address?
- Are the existing adaptation activities adequate and effective, particularly the support provided for developing countries?
- What are the social and economic impacts of the implementation of mitigation measures on developing countries?

SED 3 and SED 4 shall be held in conjunction with the fortieth session (Jun 2014) and forty-first session (Dec 2014) of the subsidiary bodies respectively. In order to ensure the full participation of developing countries, it is recommended not to have additional SED workshops, unless there is adequate funding to developing countries' delegates and experts, in accordance with paragraph 88, Decision 1/CP.18. Authors of the IPCC and experts who are not authors of the IPCC, experts from developing countries and developed countries should be invited to contribute to the dialogue in a balanced manner.

## 2. The Information Sources to be considered in the SED

This is an initial list of information sources, including but not limited to:

- The assessment, special reports and technical papers of the Intergovernmental Panel on Climate Change:
  - IPCC AR5
  - Special Report on Renewable Energy Sources and Climate Change Mitigation (2011)
  - Special Report on Special Report on Managing the Risks of Extreme Events
- Other relevant reports from Parties and processes under the Convention
  - Technology Needs Assessments reports
  - National Communications
  - ICA/IAR reports, BR/BUR reports
  - TEC/CTCN/GCF/SCF/GEF reports
  - NAPs

- Submissions from Parties
- Information from other processes
- Technical paper on Investment and financial flows to address climate change: an update
- Other relevant reports from United Nations agencies and other international organizations, such as from:
  - The Food and Agriculture Organization of the United Nations
  - The World Bank
  - The United Nations Environment Programme
  - The United Nations Development Programme
  - The South Center
  - Stockholm Environment Institute
  - The International Energy Agency
  - The World Economic Forum
  - IRENA
  - World Energy Council
  - IIASA
  - The Earth System Science Partnership
  - The World Climate Research Programme
  - The International Geosphere-Biosphere Programme
- Scientific and social economic information from reports of relevant regional and sub-regional agencies, such as:
  - The National Center for Climate Change Strategy and International Cooperation, China
  - Tsinghua University, China
  - Energy Research Institute, China
  - China Academy of Social Science
  - Tata Energy Research Institute, India
  - University of Delhi, India
  - Indian Institute of Technology Delhi
  - Indian Statistical Institute
  - Indian Institute of Science
  - Indian Institute of Management, Ahmedabad

## **II. Views on how the outcomes of the review will inform the work of the Ad Hoc Working Group on the Durban Platform for Enhanced Action, as requested by Decision 1/CP.17, paragraph 6**

Decision 1/CP.16, 2/CP.17 and 1/CP.18 provide clear mandate for the 2013-2015 Review. The objective of the Review is to periodically assess, in accordance with the relevant principles and provisions of the Convention: (a) The adequacy of the long-term global goal in the light of the ultimate objective of the Convention; (b) Overall progress made towards achieving the long-term global goal, including a consideration of the implementation of the commitments under the Convention.

Paragraph 166, decision 2/CP.17 requested the subsidiary bodies “to report on their

considerations and findings to the Conference of the Parties, which should address those considerations and provide any further guidance, as appropriate.” Paragraph 139(c), decision 1/CP.16 states, “The Conference of the Parties shall take appropriate action based on the review.”

In accordance with the above mandate, the Review can inform the ADP by collecting information and inputs, and preparing and submitting synthesis report to the COP for its consideration and appropriate action, without prejudging the work undergoing in the subsidiary bodies. Such actions by the COP may include referring the report of the subsidiary bodies on the Review to the ADP for its information and appropriate use. The information related to mitigation, adaptation, finance, technology transfer, capacity building and transparency should be treated in a balanced manner in the Review process.

-----

**AOSIS Submission on the 2013-2015 Review  
of the Long-term temperature goal**

**Views on the future work of the Structured Expert Dialogue (SED), including the  
further use of different sources of information**

The Republic of Nauru, on behalf of the Alliance of Small Island States, welcomes the opportunity to present its views on the future work of the SED, including the further use of different sources of information. These views respond to the call for submissions contained in FCCC/SBSTA/2013/5, paragraph 135, and FCCC/SBI/2013/20, paragraph 169.

**I. Introduction**

The 2013-2015 Review of the long-term temperature goal is an issue of high political importance to the Small Island Developing States (SIDS), which support a global goal to limit temperature increases to below 1.5 degrees Celsius above pre-industrial levels.

The goal of limiting global average temperature increases to below 1.5 degrees is seen as essential for minimizing damage to small island developing and low lying States in a number of areas, including:

- Sea level rise
- The protection of coral reefs
- Ocean acidification
- Extremes of heat
- Food security
- Precipitation extremes
- Water availability
- Severe weather, tropical cyclones, droughts and floods.

The difference between impacts on Small Island Developing States (SIDS) and low-lying coastal States at a long term temperature increase of 1.5 degrees above pre-industrial levels, and impacts at a long term temperature increase of 2 degrees Celsius above pre-industrial levels is enormous, in terms of the additional burden such added impacts would imply for countries that are most vulnerable to the negative impacts of climate change, resulting from the emissions of others.

It is essential that the differences between these two goals be fully explored, so that a decision that is consistent with the ultimate objective of the Convention can be taken.

**II. Status of the Review and future work of the SED**

The 2013-2015 Review of the adequacy of the long-term global goal is now underway. The Review is still in its information gathering and compilation stage through the work of the

Structured Expert Dialogue (SED), which aims to support the work of the Joint Contact Group (JCG) and so ensure the scientific integrity of the review through a focused exchange of views, information and ideas. The SED is mandated to consider scientific information relevant to the review through regular scientific workshops and expert meetings and assist in the preparation and consideration of synthesis reports on the review. See decision 1/CP.18, paragraphs 79-91.

Two very useful workshops have been held by the SED to consider the outcomes of Working Group I of the IPCC AR5 and the adequacy of progress made on adaptation and finance. Further sessions of the SED will be held in 2014-2015 to consider the outcomes of Working Group II and III of the IPCC and of the synthesis report. A critical aspect of the work of the SED must be to gather and consider information on the differing impacts in SIDS and other vulnerable countries between the impacts of climate change at long term temperature increases of 1.5 degrees Celsius, and at 2 degrees Celsius below pre-industrial levels, including how different emission pathways secure or compromise the ability to keep temperature increases to below 1.5 and 2 degrees Celsius.

The SBI/SBSTA Joint Contact Group (JCG) has set a broad outline for the work of the SED for 2014. A key consideration for the JCG for 2014 will be the establishment of a **clear timeline and process for consideration of the inputs to the Review and for the outcomes of the work undertaken in the SED**. Additionally, the JCG must consider how to make best use of the time during 2014 in the context of a possible session in October and the planning of activities in parallel with the ADP meetings to take place during that session. The SED will also need to work in 2015 to consider the outcomes of Working Group II and III of the IPCC and of the synthesis report as well as information relevant to the Review from non-IPCC sources that is produced and submitted to address information gaps.

## **II. The further use of different sources of information in the Review (i.e. non-IPCC information)**

Parties have already agreed to take into account information relevant to the Review from a wide variety of sources, including non-IPCC sources. See decision 1/CP.18, paras. 79-91.

By decision 2/CP.17, paragraph 161, Parties agreed that the review should be based on information from various sources, including the following:

- a) The assessment and special reports and technical papers of the Intergovernmental Panel on Climate Change (IPCC);
- b) Submissions from Parties, national communications, first biennial update reports from developing country Parties and biennial reports from developed country Parties, national inventories, reports on international consultation and analysis, international analysis and review, and other relevant reports from Parties and processes under the Convention;
- c) Other relevant reports from United Nations agencies and other international organizations, including reports on emission projections, technology development,

- access, transfer and deployment, and reports on gross domestic product, including projections;
- d) Scientific information on the observed impacts of climate change, including that from reports coordinated by relevant regional and sub-regional agencies.

Thus the main issues for consideration in connection with the further use of additional sources of information relate to the timing, source, process and organisation of this information.

**Timing:** Given the rapid evolution of the scientific and economic literature, effort should be made to solicit and access relevant scientifically sound studies published after the cut-off dates for the submission of information to the Fifth Assessment Report working group report process. Where relevant, existing scientifically sound literature that was not assessed by the IPCC process, or that was published after the literature cut-off dates for the AR5, should also be taken into account.

For example, a recent 2014 study has considered the degree of loss of cultural UNESCO world heritage sites related to different temperature increases and related sea level rise<sup>1</sup>. Another study revealed the potential of destabilization of parts of East Antarctica corresponding to 3-4 m sea-level rise.<sup>2</sup> This new insights are relevant to the 2013-2015 review of the temperature goal.

**Source and criteria:** The JCG and SED should also invite scientific information, relevant reports and studies that have been produced by UN agencies, international organisations, relevant regional organisations, sub-regional agencies and national agencies and which may not have been used in the IPCC process, but that are nevertheless highly relevant. The relevant scientifically sound research and studies undertaken by these bodies might otherwise be overlooked with a sole focus on peer-reviewed articles, despite their expertise.

Examples of such organisations and bodies include the Food and Agricultural Organisation, UN Development Programme, UNESCO, International Organisation on Migration, SPREP (South Pacific Regional Environment Programme), the Caribbean Community Climate Change Centre and other regional bodies. These organisations and agencies should be invited to provide information on modelled or projected regional impacts related to long-term temperature increases of 2 degrees and 1.5 degrees above pre-industrial levels.

For example, UNDP has been involved in a project on climate change and sea level rise impacts in the Caribbean and Pacific.<sup>3</sup> This project overlaid high-resolution climate models on the Caribbean region to map likely sea level rises if average global temperatures were to increase by 1.5 degrees Celsius or by 2 degrees Celsius. The results gave an overview of the

<sup>2</sup>Mengel, M. & Levermann, A., Ice plug prevents irreversible discharge from East Antarctica. *Nat. Clim. Change* 5 (2014).

<sup>3</sup>See <http://intasave-caribsavae.org/climate-change-caribbean-pacific/>

potential different effects on coral reefs, water supplies and agriculture. The project's second phase quantified the cost of these impacts on key sectors of the economy, putting a price on replacing lost environmental benefits like fresh drinking water.<sup>4</sup> Information on these effects is clearly relevant to the Review.

**Process:** Parties and relevant, credible, international and regional organisations and agencies should be invited to submit any scientifically sound studies of which they are aware, as well as studies and reports they have prepared that may not have been peer-reviewed but which are relevant, identifying observed and projected regional impacts and costs at different temperature thresholds in different regional and national contexts. This information should be collected by the SED, synthesized by the secretariat, and presented by these organisations, agencies and by non-IPCC regional experts at expert meetings and workshops.

**Organisation of information solicited:** The information gathered could be solicited, organized and submitted under the following categories:

- a) Impacts, vulnerability and risks at warming levels of 1.5 and 2 degrees Celsius above pre-industrial levels on: sea level rise, water availability, crop production, ecosystem health, terrestrial and marine biodiversity, vulnerable populations, ocean acidification, food security, regional and national economic systems, territorial integrity, migration.
- b) Impacts, vulnerability and risks at different levels of atmospheric CO<sub>2</sub> concentration including 350 ppm on: ocean acidification, marine systems, production and biodiversity, crop production and quality, ecosystem health, terrestrial and marine biodiversity.
- c) Costs of adaptation at warming levels of 1.5 and 2 degrees above pre-industrial levels.
- d) Risks of rapid adverse changes in climate extremes and extreme events, risk of crossing of tipping points for sea level rise, the carbon cycle, natural systems and/or socio-economic systems at warming levels including 1.5 and 2 degrees above pre-industrial levels.

Once the information is received, the Secretariat could be tasked with synthesizing what has been submitted in each area for the consideration of the SED.

### III. Importance of regional information

In addition to the submission of this information, it would be useful if, beginning at the session after the June 2014 meeting of the Subsidiary Bodies, activities could be organized featuring *presentations by experts from regional bodies or research institutions* to present, in particular, regional information relevant to the Review. This will be important, as the IPCC WG II report emphasizes that climate change impacts will differ between and within

---

<sup>4</sup>Project reports indicated that the type of impacts of each scenario would be largely the same for island communities but the scale of impacts would vary dramatically in different countries in the region.

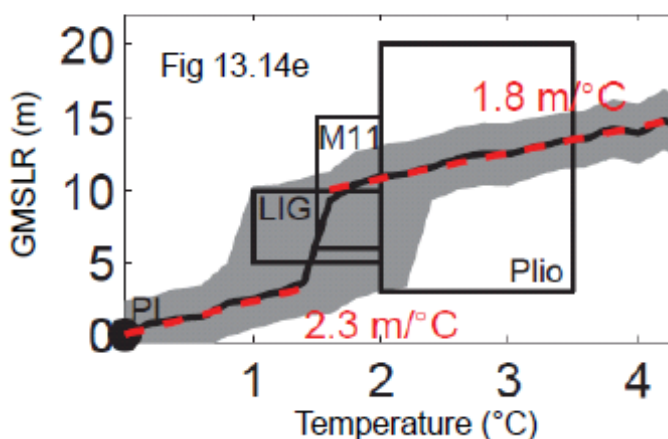

regions, with some regions projected to experience far higher temperature increases and impacts than others at different temperature thresholds.

#### IV. Irreversible impacts should be identified by the SED

There have been a number of inputs discussed by the SED that have value for ongoing ADP discussions. For example, a presentation on sea level rise noted that a likely range of global mean sea level rise for the period 2081–2100 compared with 1986–2005 of 0.40 [0.26–0.55] meters for RCP2.6, and 0.63 [0.45–0.82] meters for RCP8.5 is projected with medium confidence. In other words, the lowest and highest stabilisation scenarios would imply quite different outcomes for sea level rise as soon as 2081-2100. This has direct implications for impacts on SIDS and low-lying coastal countries, and hence should also have a direct influence on the choice of long-term goal for the 2015 agreement.

The SED also discussed the fact that long-term global mean sea level rise (GMSLR) is not proportional to global mean surface warming, but that between 1.5° and 2°C a steep rise in sea levels has to be expected due to large scale ice sheet disintegration<sup>5</sup> (See graphic below on commitment to sea level rise and irreversibility). This also has direct implications for the choice of long-term global goal used to guide the 2015 agreement in light of the irreversible impacts to which a 2°C goal would commit the international community over time spans of several decades even if GHG emissions were drastically reduced.

Commitment to sea level rise and irreversibility

The  
IPCC

's Working Group II Report's Summary for Policymakers reports that for unique and threatened ecosystems and cultures, and for extreme weather events, **risks are already high around 1.5°C warming above pre-industrial levels** (1°C above recent levels). Risks for large-scale singular events such as ice sheet disintegration, methane release from clathrates, and onset of long-term droughts increase disproportionately as temperatures rise above 1.5 °C. See Box SPM.1.

<sup>5</sup>Jonathan Gregory, Lead Author, Chapter 13, IPCC Sea level rise, Presentation to SED-2.

## **V. Important aspects of the IPCC WGII Report on SIDS should be taken up by the SED**

Many findings with respect to the vulnerability of SIDS have not changed since the IPCC's Third Assessment Report. Chapter 19 of the TAR detailed some of the threats facing Small Island States and low lying coastal states as follows:<sup>6</sup>

### **“19.3.4.1. Threatened Small Island States**

Because of their low elevation and small size, many small island states are threatened with partial or virtually total inundation by future rises in sea level. In addition, increased intensity or frequency of cyclones could harm many of these islands. The existence or well-being of many small island states is threatened by climate change and sea-level rise over the next century and beyond.

Many small island states—especially the atoll nations of the Pacific and Indian Oceans—are among the most vulnerable to climate change, seasonal-to-inter-annual climate variability, and sea-level rise. Much of their critical infrastructure and many socioeconomic activities tend to be located along the coastline—in many cases at or close to present sea level (Nurse, 1992; Pernetta, 1992; Hay and Kaluwin, 1993). Coastal erosion, saline intrusion, sea flooding, and land-based pollution already are serious problems in many of these islands. Among these factors, sea-level rise will pose a serious threat to the ecosystems, economy, and, in some cases, existence of many small island states. It is estimated that 30% of known threatened plant species are endemic to such islands, and 23% of bird species found on these islands are threatened (Nurse et al., 1998). Projected future climate change and sea-level rise will lead to shifts in species composition (see Chapter 17).

Many small island nations are only a few meters above present sea level. These states may face serious threat of permanent inundation from sea-level rise. Among the most vulnerable of these island states are the Marshall Islands, Kiribati, Tuvalu, Tonga, the Federated States of Micronesia, and the Cook Islands (in the Pacific Ocean); Antigua and Nevis (in the Caribbean Sea); and the Maldives (in the Indian Ocean). Small island states may face the following types of impacts from sea-level rise and climate change (Gaffin, 1997; Nurse et al., 1998):

- Increased coastal erosion
- Changes in aquifer volume and water quality with increased saline intrusion
- Coral reef deterioration resulting from sea-level rise and thermal stress
- Outmigration caused by permanent inundation
- Social instability related to inter-island migration
- Loss of income resulting from negative effects on tourist industry
- Increased vulnerability of human settlement due to decrease in land area
- Loss of agriculture and vegetation.

Gaffin (1997) concludes that without planned adaptation, the vulnerabilities of small island states are as follows:

---

<sup>6</sup> <http://www.ipcc.ch/ipccreports/tar/wg2/index.php?idp=671>

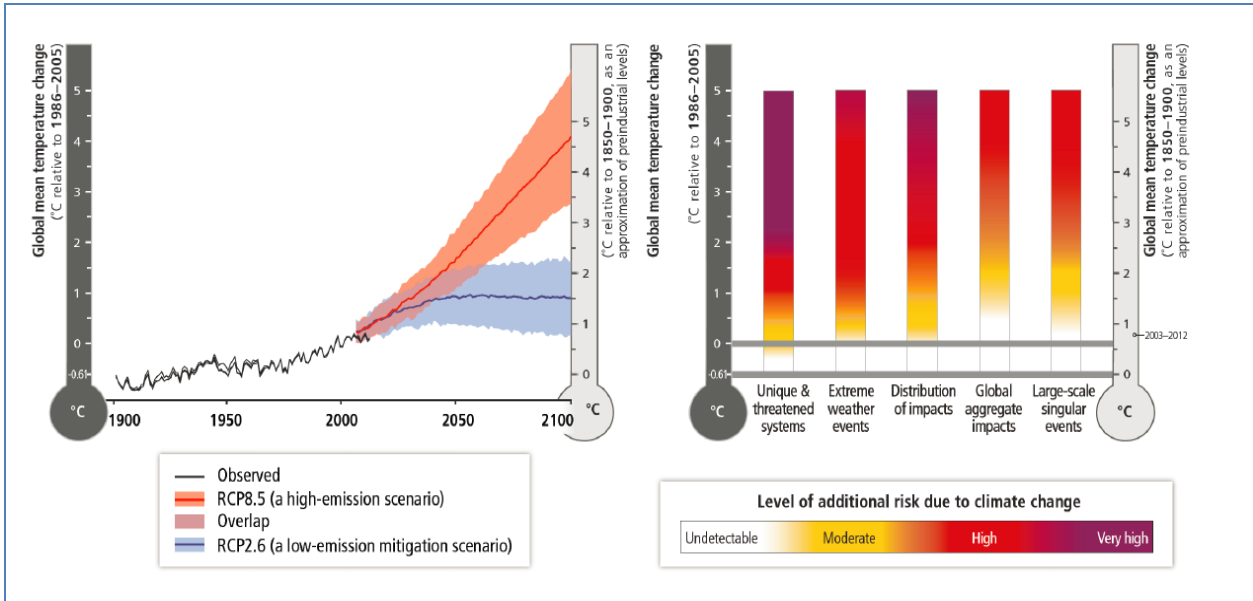

- An 80-cm sea-level rise could inundate two-thirds of the Marshall Islands and Kiribati.
- A 90-cm sea-level rise could cause 85% of Male, the capital of the Maldives, to be inundated (Pernetta, 1989)."

This information remains relevant for the Review. The IPCC Fifth Assessment Report's WGII Chapter on small islands builds on the TAR, finding that:

"Small island economies can also be objectively shown to be at greater risk from sea-level rise in comparison to other geographic areas since most of their population and infrastructure are in the coastal zone. This is demonstrated in a study using the Climate Framework for Uncertainty, Negotiation and Distribution (FUND) model to assess the economic impact of substantial sea-level rise in a range of socio-economic scenarios downscaled to the national level, including the four SRES storylines (Anthoff et al., 2010). Although this study showed that in magnitude, a few regions will experience most of the absolute costs of sea-level rise by 2100, especially East Asia, North America, Europe and South Asia, these same results **when expressed as percent of GDP showed that most of the top ten and four of the top five most impacted are small islands from the Pacific (Federated States of Micronesia, Palau, Marshall Islands, Nauru) and Caribbean (Bahamas). The point is made that the damage costs for these small island states are enormous in relation to the size of their economies** (Nicholls and Tol, 2006) and that together with deltaic areas they will find it most difficult to locally raise the finances necessary to implement adequate coastal protection (Anthoff et al., 2010)." (emphasis added)

This level of detail will be essential in communicating the outcomes of the Review.

Graphics contained in the IPCC's Working Group II Report's Summary for Policymakers indicate that for unique and threatened ecosystems and cultures, and for extreme weather events, **risks are already high around 1.5°C warming above pre-industrial levels** (1°C above recent levels):

Graphics contained in other recent reports also provide useful detail for the review. See Marzeion, B. & Levermann, A., Loss of cultural world heritage and currently inhabited places to sea-level rise, 2014 *Environ. Res. Lett.* 9 034001 (4 March, 2014), Figure 1, (attached) [http://iopscience.iop.org/1748-9326/9/3/034001/pdf/1748-9326\\_9\\_3\\_034001.pdf](http://iopscience.iop.org/1748-9326/9/3/034001/pdf/1748-9326_9_3_034001.pdf)

**Figure 1.** (a) Number of cultural UNESCO world heritage sites impacted by SLR, and depth of the sites below sea level, as a function of  $\Delta T$ . (b) Increase of the percentage of national land surface lying below sea level, as a function of  $\Delta T$ , sorted by descending loss of land surface. (c) Percentage of world population living in areas above current, but below future sea level, as a function of  $\Delta T$  and country, sorted by descending percentage of living places affected.
