Global goal on Adaptation

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

- The Paris Agreement (Dec 2015) reinforced the international framework for adaptation action by **establishing a Global Adaptation Goal of *enhancing adaptive capacity, strengthening resilience and reducing vulnerability to climate change*, with a view to contributing to sustainable development and ensuring an adequate adaptation response in the context of the temperature goal referred to in Article 2.**
- All Parties are now **requested, but not required**, to monitor and evaluate adaptation activities at the national level (UNFCCC, 2015a) and to **periodically take stock** of the collective progress made towards achieving this global goal, through the “global stocktake” process.

Almost half of the Parties who included adaptation within their NDCs, reference the importance of M&E indicating ongoing or planned efforts, for:

- **Learning:** improving effectiveness and efficiency of the adaptation process
- **Accountability:** demonstrating that actions have led to a result.

Relatively few countries, however, have designed and implemented a national system for adaptation M&E (rather than e.g program or project level)

- Approaches to date combine **qualitative and quantitative indicators**, ranging between 3 (Mexico) and over a 100 (France, Germany, Kenya, the Philippines) with **qualitative analysis**.
- Indicators can monitor trends in climate **exposure and vulnerability**, realised **impacts of climate events**, and/or assess either **adaptation processes** or **outcomes**.

Challenges of national-level M&E

Challenges for M&E that addresses **adaptation co-benefits and resilience**:

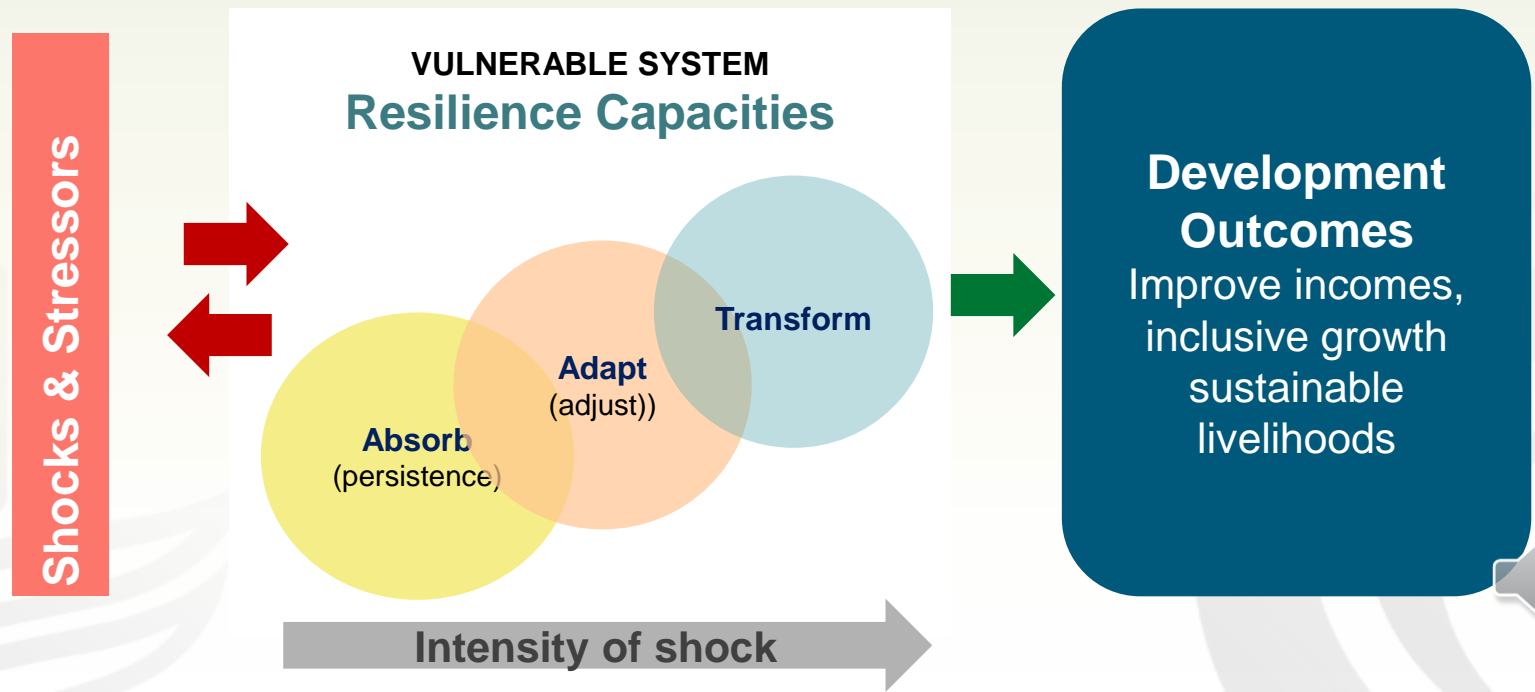

- Nature of climate adaptation (e.g. long timescales for impacts and outcomes)
- Multi-dimensional (economic, financial, social) nature of resilience
- Multi-scale: need for aggregating information horizontally across climate-sensitive sectors, and vertically across different levels of government
- Lack of an “off the shelf” methodology and single metric to assess related outcomes
- Difficulty to identify, combine and interpret the types and relevant indicators
- Country capacity and resource constraints.
- uncertainty inherent to our understanding of the climate system

How to operationalize adaptation and resilience building in agricultural systems?

Adaptation (UNFCCC): **adjustments** in ecological, social or economic systems in **response** to actual/expected climatic stimuli/effects; **changes in processes, practices and structures** to moderate potential damages or to benefit from opportunities.

Climate resilience: dynamic capacity of a system **to absorb** the impacts of climate-related shocks and stressors (e.g floods, droughts, land degradation, heat, and water stress) to **adapt to, change** and to potentially **transform**, in a manner that enables the achievement of development outcomes

Conceptualizing resilience building interventions

Capacity to Transform

Transform the enabling environment (longer term) by enhancing governance and conditions for resilience, through investing in

- Governance, trading relationships, formal safety nets
- Access to Infrastructure/services
- Social protection mechanisms
- Policies, regulations

Capacity to Adapt
(adjust))

Proactively respond to changes in external drivers, sustaining/improving productivity and continue operating:

- Livelihood diversification
- Adoption of improved-climate proofed technologies and practices
- Access and use of climate information
- Access to market and financial services

Capacity to Absorb
(persistence)

Cope through Risk management strategies

- Changes or adjustments in varieties/breeds
- Crop/livestock insurances
- Use cash saving

How to track progress towards the Adaptation Goal?

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

- Proliferation of initiatives and frameworks on developing systems for adaptation M&E at all levels.
- Literature focused on providing guidance to develop national level systems for M&E (GIZ and IISD, 2016), or information and insights from a set of existing systems (OECD, 2015b; EEA, 2015; GIZ and IISD 2013).

Multiples tools, indicators and reporting requirement that need to be aligned!

Indicators for adaptation decision-making under climate change: A proposed evaluation model
Nemi Watanabe
School of Economics and Management, Kochi University of Technology, 2-22 Elkokuji, Kochi City, Kochi 780-8515, Japan

ABSTRACT

This study... developing a set of indicators for evaluating, prioritizing and choosing... A simulation process is further conducted to... adaptation alternatives to drought... face-to-face discussions... derived broad results... adaptation... provide a... reserved.

169 targets

231 indicators

Logframe for M&E of adaptation/resilience building actions

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

Indicators types *Examples*

Climate impacts

% of total livestock killed by drought in a given year

Ha of productive land lost to soil erosion

Readiness

of mechanisms identified which could potentially fund adaptation

Process

Proportion of national and local government officers received trainings on climate change adaptation over the last 5 years

Provision of services CIS/ financial services to farmers(%)

Output

Proportion of agricultural land under irrigation

Extent of climate resilient practices/technologies (Ha, % operations, % supply)

Outcome

Average income of small-scale food producers (SDG)

Global food loss index (SDG)

So what are co-benefits might we think about?

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

At the top: **Sustainable Development**

Through agricultural adaptation efforts that contribute to:

- Poverty reduction
- Improved food security, including improved nutrition
- Reduced gender gap
- Empowerment of youth
- Biodiversity conservation
- Improved ecosystem services (water resources, pollinators, nutrient cycling etc.)
- Strengthened institutions (from community to national level)
- Improved governance
- Climate mitigation
- ...and the list goes on...

Whirlwind through some resources

FAO's Tracking Adaptation in Agricultural Sectors

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

- Need for inclusion of standard indicators of (sustainable) development performance to track progress towards reduced vulnerability and enhanced adaptive capacity (FAO 2017)

- Post Paris Agreement: Framework and methodology for Tracking Adaptation in Agricultural Sectors & list of Indicators (FAO 2017)
- Takes account of ongoing national efforts for reporting to major international mechanisms (including the UN's SDGs and Sendai Framework for Disaster Risk Reduction)

FAO's framework and methodology for Tracking Adaptation in Agricultural Sectors

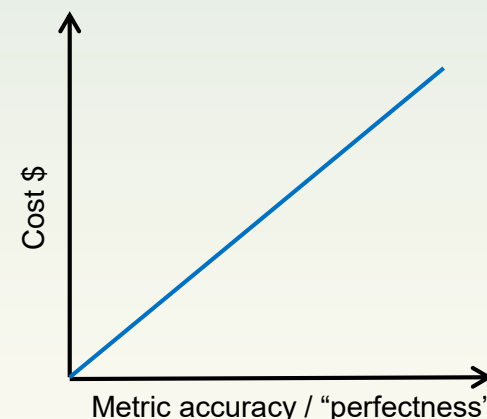

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

MAIN AND SUBCATEGORIES OF INDICATORS TO TRACK ADAPTATION IN AGRICULTURE	
Main categories	Subcategories
Natural resources and ecosystems	1 Availability of, and access to, quality water resources for agriculture
	2 Availability of, and access to, quality agricultural land and forests
	3 Status of ecosystems and their functioning
	4 Status of the diversity of genetic resources in agriculture
Agricultural production systems	1 Agricultural production and productivity
	2 Sustainable management of agricultural production systems
	3 Impact of extreme weather and climate events on agricultural production and livelihoods
	4 Projected impact of climate change on crops, livestock, fisheries, aquaculture and forestry
Socio-economics	1 Food security and nutrition (vulnerability)
	2 Access to basic services
	3 Access to credit, insurance, social protection in rural areas
	4 Agricultural value addition, incomes and livelihood diversification
Institutions and policy making	1 Institutional and technical support services
	2 Institutional capacity and stakeholder awareness
	3 Mainstreaming of climate change adaptation priorities in agricultural policies, and vice versa
	4 Financing for adaptation and risk management

(FAO 2017)

Revision, additions and edits led to a selection of 28 Indicators to monitor adaptive capacity/resilience

“Less is More” Principle Tracking:

- Climate impacts
- Resilience processes
- Outcomes

Measuring Co-Benefits: Lessons from Ecosystem-Based Adaptation

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

TOPIC AREA/PURPOSE	INDICATOR EXAMPLE (SOURCE)
For monitoring and evaluating changes in ecosystem services	River base flow (UNFCCC, 2013)
	Changes in groundwater & surface water quality (UNFCCC, 2013)
	Monitoring/evaluating changes in adaptive capacities and ecosystem resilience
	Measuring any improvement in water use efficiency to maintain ecosystem integrity, i.e.:
	- amount of surface water extracted for irrigation in project sites;
	- number of monitored wells increasing groundwater efficiency in project sites) (UNFCCC, 2013)
	Measuring improvement in land-use practices and climate change resilience. i.e.:
	- total hectares of riparian and wetland habitat restored with native vegetation within project sites;
	- total number of hectares with ecosystem-based approaches (UNFCCC, 2013)
	Measuring the decrease in average rural poverty rate within project area i.e. the targeted watersheds (UNFCCC, 2013).
Measure increase and diversification of income (UNFCCC, 2013).	
Assess community support for ecosystem-based approaches for adaptation (UNFCCC, 2013)	
Monitoring ongoing governance and legal provisions allocating environmental flows (UNFCCC, 2013)	
Level of climate preparedness (Spearman & Dave, 2012).	
Assess ecosystem services and natural assets maintained or improved under climate change and variability-induced stress (outcome based). e.g.:	
- Measure changes in hectares (i.e. hectares improved through soil & water conservation methods such as reduced deforestation, improved integrity of ecosystems, reduced erosion and degradation, improved water retention, etc.).	
- Technical studies by government or specialized agencies, satellite maps, and before-and-after photographic evidence to estimate the area of improved land.	
- Measure through changes in species population numbers (dynamics, structure, etc.) (AF, 2011:91-92)	
Number & type of natural resource assets created, maintained or improved to withstand conditions resulting from climate variability and change (by type of assets): e.g.: - Number of interventions by type of natural asset and intervention (AF,2011:95).

Measuring Co-Benefits: Lessons from Ecosystem-Based Adaptation

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

Structural flood protection, resettlement, and environment management	Flood control level (OECD, 2009)
	Satisfaction level of relocated persons restored to pre-resettlement levels in terms of income and livelihood (OECD, 2009).
	Percentage of environment management plan monitoring targets achieved (OECD, 2009).
	Warning time against potential floods in project area (OECD, 2009).
Water supply (source: Cabell & Oelofse, 2012)	Number and type of wells installed (output indicator)
	The number and proportion of population with sustained availability of clean water for proper domestic use (outcome indicator)
	Reduction in ill health and mortality (impact based)
Environment (source: Cabell & Oelofse, 2012)	Number of species planted properly and surviving (output indicator)
	New areas reforested and sustainable agricultural practices applied (outcome based)
	Better economic opportunities for local or marginalised communities (outcome based)
	Retention or increase in forest areas (impact based)
Human rights (source: Cabell & Oelofse, 2012)	Number and category of people given training or other types of support (output based)
	More active censure of politicians and law-enforcing agencies (outcome based)
	Greater financial allocation by government to monitor and address human rights abuse (outcome based)
	More transparent, accountable state behaviour (impact based)

Toolkit(s): CLA Toolkit

The USAID/E3 Forestry and Biodiversity Office has released three Biodiversity Programming How-To Guides to help with these questions: 1) *Developing Situation Models*; 2) *Using Results Chains to Depict Theories of Change*; and 3) *Defining Outcomes and Indicators for Monitoring, Evaluation, and Learning*. These How-To Guides provide in-depth guidance on key tools and practices to support teams (USAID and implementing partners) as they design and manage programs within USAID's Program Cycle and in accordance with the Agency's Biodiversity Policy.

Every year, USAID invests enormous amounts of financial and human resources into programming directed at conserving biodiversity in priority places, and integrating biodiversity as an essential component of human development. But, how can the Agency know if that intended biodiversity conservation impact is achieved? Moreover, how can teams learn from and improve strategic approaches? The conservation community continuously works to find the best options to address these questions.

METRICS FOR MONITORING MITIGATION

- Total emissions (CO₂e)
 - Avoided losses or sequestration of C (or CO₂)
-

- Total emissions and carbon sequestration (CO₂e) per unit of production (emissions intensity)
- Emissions per unit of value added (SDG indicator 9.4.1)

(Vermeulen & Frid-Nelson 2017)

Compared to a historical baseline (2010)

Conclusions

- Adaptation itself is hard enough to measure
- Adaptation co-benefits are endless and intertwined to almost all of the SDGs
- Plenty of resources already exist – no need to re-invent the wheel
- Need for pragmatism in what is worth measuring (cost/benefit)
