

Tajikistan's written answer to the question from FSV (6/12/2021)

Question

Tajikistan reports that, in 2014, LULUCF represents in absolute terms slightly more than 17% of the total national greenhouse gas emissions. Considering that only 3% of the country is covered by forest, could you please let us know which are the most important source or sinks in the LULUCF sector in Tajikistan?

Answer

The most important source of sinks in the LULUCF sector in Tajikistan are forests, pastures and the growth of horticulture and viticulture, as well as the development of beekeeping within the framework of state programs of the agricultural sector.
