

NEW GEOSPATIAL TECHNOLOGIES TO SUPPORT RESULTS-BASED REDD+ ACTIONS IN DEVELOPING COUNTRIES

In the recent years, FAO in collaboration with  has developed new technologies to support developing countries in monitoring and assessing their territories. Here we present Collect Earth and Earth Map

Food and Agriculture
Organization of the
United Nations

Federal Ministry for the
Environment, Nature Conservation,
Building and Nuclear Safety

The International Climate Initiative (IKI)

Collect Earth

an innovative tool

Danilo Mollicone

Ingredients for the success:

1) Open source software

2) Developed on  technology

3) Rely of existing open source software (e.g. Saiku)

4) Learning from what is working

5) A clear strategy from measurements to submission under

Learning from what is working:

Collect Earth has been developed
by learning from experiences from Annex I
countries reporting activity data under
UNFCCC

All Annex I countries use IPCC Approach 3 to assess activity data:

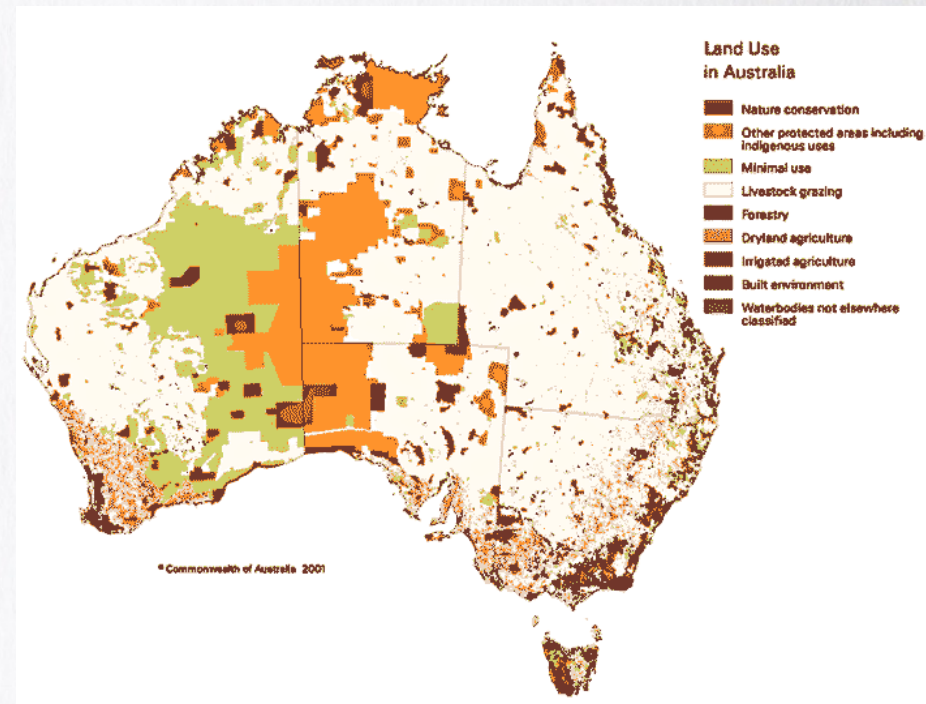

39 countries use
mainly sampling approaches

Sweden

3 countries use
mainly wall to wall approaches

Australia

National Inventory Report

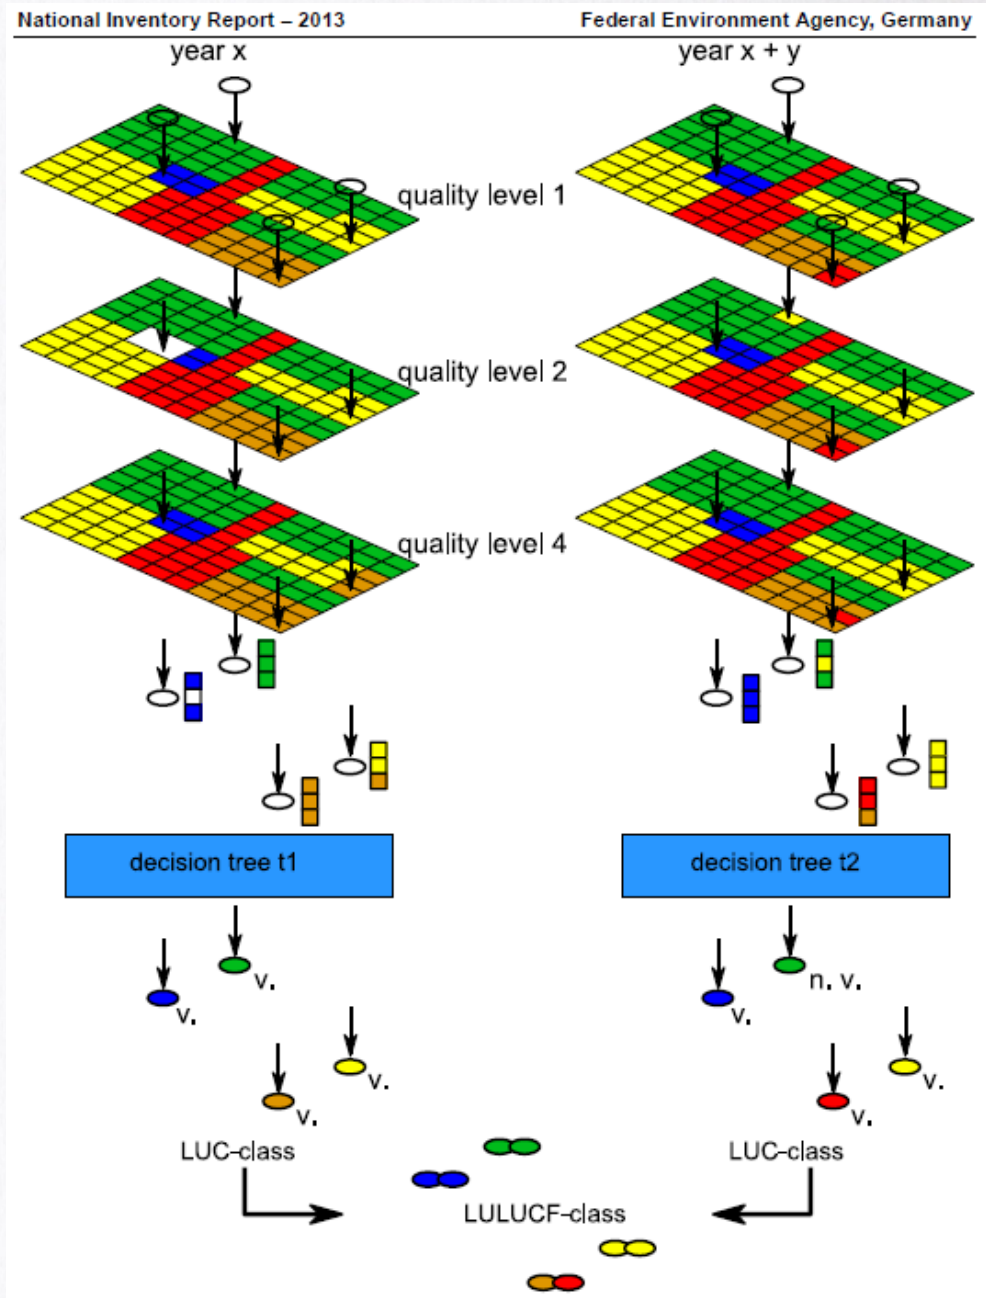

Germany

Schematic representation of allocation of sample points to a land-use category

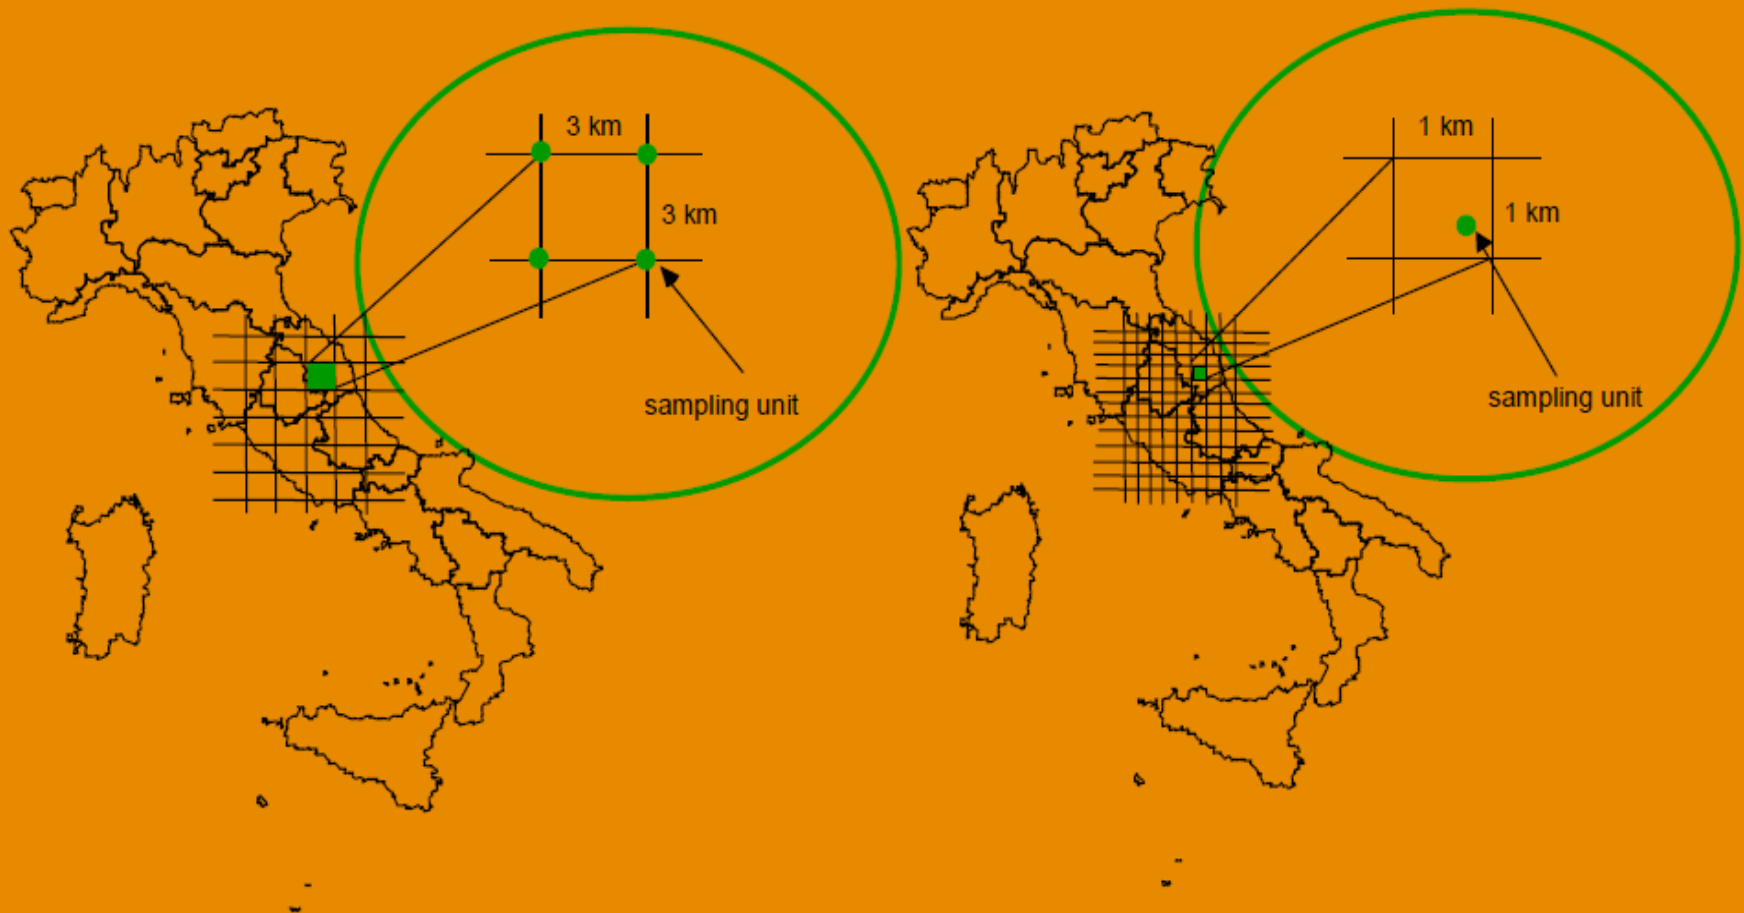

GHG NIR Germany 2013

http://unfccc.int/national_reports/annex_i_ghg_inventories/national_inventories_submissions/items/7383.php

The National Forest Inventory surveys the state of forests, and of forest production potential, on a large scale throughout Germany, using a standardised sampling procedure. The National Forest Inventory is a terrestrial sampling inventory that uses permanently marked sample points in a 4 km x 4 km basic grid whose resolution, at the request of the Länder, has been increased on a regional basis

Table 2.1—Summary of general attributes associated with FIA Phase 1, Phase 2, and Phase 3 sampling

Attribute	Phase 1	Phase 2	Phase 3
Sample type	Photo point or satellite pixel	Ground plot, subset of Phase 1	Ground plot, subset of Phase 2
Sample configuration	Point or pixel	Cluster of four 1/300-acre micro-plots, four 1/24-acre subplots, and optional four 1/4-acre macroplots	Same as Phase 2 ^a
Purpose	Stratification ^b of the landscape for the purpose of variance reduction	Samples FIA traditional attributes of interest, primarily related to tree species of all sizes	Samples FIA traditional attributes of interest, ^c plus additional attributes associated with forest health
Tessellation method	Supplemental regional grid superimposed over the population of interest ^d	Systematic national hexagonal cell grid	Systematic national hexagonal cell grid (subset of Phase 2 grid)
Base-grid intensity	At the discretion of each FIA unit	One plot per every 6,000-acre hexagonal cell	One plot per every 1/16 6,000-acre hexagonal cell (i.e., one per 96,000 acres)

NFI Sampling design in Czech Republic

Figure 1. Czech NFI2 sampling grid.

Figure 2. Grid points in the interpretation quadrat

The photogrammetric assessment will take part on a four times denser sample grid, with a limited set of acquired variables.

Inventory concept

There are more than 500 million trees in Switzerland - far too many to investigate individually. Random sampling, however, yields adequate information. For that purpose a 1km-grid was mapped over Switzerland in the first NFI. The intersections defined the location of the sample plots in the forest.

Since the second NFI, only half of these plots, roughly 6500, have been located in the field. The grid, which originally had a mesh size of 1 km, was extended to 1.4 km. To compensate for this reduction, the aerial photos were interpreted in a grid of 500 m.

The same methods have been carried out since switching from a periodic to a continuous survey in the fourth NFI, but the sample plots are now located over a period of nine years. Thereby another ninth of the sample plots, which are evenly distributed all over Switzerland, are surveyed every year.

Circles and radii of sample plots

The center of the sample plot is marked by a metal pole in the ground. Roughly 130,000 sample trees were measured in the NFI1 and marked so as they can be found again in later inventories. Thanks to the exact sketches, about 98% of the sample plots could be found directly during the NFI2 without having to search for them. In the NFI4, the position of the centers of the sample plots are located exactly with a GPS.

Within a 200 m² circle, every tree which has a diameter larger than 12 cm is recorded, and within a 500 m² circle, every tree which has a diameter larger than 36 cm is recorded. These diameters are measured at a height of 1.3 m (diameter at breast height DBH). The radii are 7.98 m (r_1) and 12.62 m (r_2) on level terrain.

- 1 NF13 sample plot
- 2 circle for survey of trees with a DBH greater than 36 cm.
- 3 circle for survey of trees with a DBH greater than 12 cm
- 4, 5 circle for survey of young forest
- 5, 6, 7 transect for survey of deadwood
- X sample plot center

New global forest geography:

FOREST ECOLOGY

The extent of forest in dryland biomes

Jean-François Bastin,^{1,2*} Nora Berrahmouni,¹ Alan Grainger,³ Danae Maniatis,^{4,5} Danilo Mollicone,¹ Rebecca Moore,⁶ Chiara Patriarca,¹ Nicolas Picard,¹ Ben Sparrow,⁷ Elena Maria Abraham,⁸ Kamel Aloui,⁹ Ayhan Atesoglu,¹⁰ Fabio Attore,¹¹ Çağlar Bassüllü,¹² Adia Bey,¹ Monica Garzuglia,¹ Luis G. Dryland biomes cover two-fifths of Earth's land surface, but their forest area is poorly known. Here, we report an estimate of global forest extent in dryland biomes, based on analyzing more than 210,000 0.5-hectare sample plots through a photo-interpretation approach using large databases of satellite imagery at (i) very high spatial resolution and (ii) very high temporal resolution, which are available through the Google Earth platform. We show that in 2015, 1327 million hectares of drylands had more than 10% tree-cover, and 1079 million hectares comprised forest. Our estimate is 40 to 47% higher than previous estimates, corresponding to 467 million hectares of forest that have never been reported before. This increases current estimates of global forest cover by at least 9%.

The screenshot displays a web application interface for visualizing climate data. The browser's address bar shows the URL `reactivlayers-danieldioniso.cluvs.io:3080`. The main content area features a map of the Caucasus region, specifically focusing on Armenia and Azerbaijan. A map control in the top-left corner includes a 'Map' button and a 'Satellite' button. The map itself is titled 'Kvemo Kartli: Max Temperature' and shows a color-coded temperature distribution over the region. A legend on the right side of the map indicates that the color scale represents 'Max Temperature' in degrees Celsius, with a range from 10.00 to 15.00. A line graph on the right side of the map shows the temperature trend from 1990 to 2015, with a red line indicating the trend and a blue line showing the monthly data. The graph is titled 'Max Temperature' and has a y-axis labeled '°C' ranging from 10.00 to 15.00. The x-axis is labeled 'Year' and ranges from 1990 to 2015. The legend for the graph shows a blue line for 'M.' (Monthly) and a red line for 'Trend'.
