Supervisory Body

United Nations Framework Convention on Climate Change (UNFCCC)

Dear Supervisory Body:

Subject: Structured Public Consultation - Removal Activities

We agree that Engineering-based removal activities are technologically and economically unproven. In fact, they may even be dangerous.

Extracting geothermal energy from the earth to perform CO₂ capture in Nordic Regions is an instance of such dangerous ventures, the energy released causing ice and snow melt down. Combined with the fact that CO₂ capture and sequestration is an unproven technique, we are heading to a disaster.

At Elitelco France/Belgium we are demonstrating that CO₂ Removal must be performed simultaneously with atmosphere energy removal. CO₂ Removal and CO₂ Emission Reduction without energy removal cannot reduce Atmosphere CO₂ concentration due to the laws of physics. The atmosphere CO₂ concentration curve from the Kyoto Protocol till nowadays offers an evident clue.

Yours sincerely,
Phan Ngoc Ngan.
Elitelco
