In the project "Strengthening civil society in the development and implementation of national climate policies", the Independent Institute for Environmental Issues (UfU e.V.) and Friends of the Earth Germany (BUND) analyse in different studies how civil society is involved in setting climate policies at the national level.

About the studies:

Five key dimensions form the methodological framework of analysing civic space in climate policies. Altogether they make up five fingers (see below). Different case studies inquire the specific framework for participation in each country as well as identify barriers and examples of good practice. Based on the results, the project team formulate concrete recommendations on how to secure and expand civic spaces in climate policy.

Good practices (pdf)
