

What are the opportunities and challenges for the considerations regarding different groups ... and policy issues across land management and CCA?

Opportunities : the increasing recognition on the need for building synergy between different groups and actors.

the development of the green recovery plans, NDC and LTS

Agree with the participants that this is an excellent opportunity to address land tenure and land rights when dealing with climate change adaptation

There should be a platform for different groups to be given a voice. One of the policy issues would be the power struggle federal vs states

Climate policies on land are a matter of both mitigation and adaptation: adapted and resilient ecosystems are needed to maintain and enhance carbon sinks, while land-based mitigation responses, can improve the resilience of ecosystems .

one common understanding

Challenges : the fact that authorities related to land management and CCA attach to number of Ministries/sectors brings consequences that hinder fast and effective coordinated actions.

Inclusiveness of all stakeholders in the measurement, reporting and verification of the performance of policy instruments can support sustainable land management.

Opportunity: scientific programmes promoting the use of Earth observations can support sound policy development for land management, and CCA in multiple land sector

What are the opportunities and challenges for the considerations regarding different groups ... and policy issues across land management and CCA?

It is still unknown the future climate scenarios at appropriate scale (particularly for agriculture). Not available meteorological information.

Improving sustainable land management could help addressing climate change adaptation, in this way we maximize the limited resources

There are major opportunities in promoting synergies between adaptation and mitigation through sustainable land management practices. The challenge to robust policy frameworks to address differentiated vulnerabilities, and the unique role indigenous

Some of the opportunities include good policies in all sectors related to land; but the challenge is that most of them are not linked. There is need to consider a multi-sector approach

Challenges include power differentials - the right and access to land tenure, excessive land ownership and intensive agriculture interests. Opportunities include greater appreciation for the role of nature restoration and rights-based approaches.

Opportunities: Inclusion and identification of adaptation action of a diverse group. Challenges: Resources for implementing adaptation action and a blanket policy for all.

Indigenous and local knowledge of flora, fauna, and climate systems is of utmost importance for climate change adaptation responses.

Efficient production of safe and sustainable food is important for adaptation - producing more with less inputs and impacts eases land-use pressures. And removing barriers to trade can create environmental benefits, for instance through ACCTS,

Integrating forests into agricultural landscapes can reduce carbon footprints, improve water quality (through reduced run-off), improve biodiversity, and achieve positive animal welfare outcomes (from shade and shelter for livestock)

What are the opportunities and challenges for the considerations regarding different groups ... and policy issues across land management and CCA?

After the two days of meeting, I will intervene for both Land and Oceans due to the fact that life is based on both sectors. Land and oceans are natural and under extreme pressure of humans. Need, create programs strengthen and make them resilient

It is clear that we need to deepen our conversation on how to build resilience of the land system, which in turn will have positive results in all other sectors. It should be considered across all Rio Conventions and other stakeholders and organizations

What actions are needed to leverage the opportunities and address the challenges and gaps to strengthen policy approaches for land management and CCA?

We need mutual benefit approach between land mgmt and CCA

The new EU Adaptation Strategy is expected to: improve knowledge of climate impacts and solutions to reinforce planning and climate risk assessment to accelerate adaptation action to strengthen climate resilience globally

More coordination between existing government agencies and UN agencies and bilateral cooperation to address the linkages between sustainable land management and climate change adaptation and mitigation

Build strong leadership and clear institutional arrangements to facilitate a synergic and effective coordination across sectors and actors.

Education

It is necessary to include policies related to climate change into the specific sectorial strategies, with clear indicators both for mitigation and adaptation.

funding mechanisms, integration into climate plan

There need to bring all players together, in other words, consider a multi-sector approach

Governments and other partners should further promote and fund scientific cooperation on the use of Earth observations to monitor land variables needed to make sound policy decisions about land management and CCA

What actions are needed to leverage the opportunities and address the challenges and gaps to strengthen policy approaches for land management and CCA?

Inclusion of Indigenous People's rights in strengthening policy approaches for land management. Also attention to small scale farming and agro-ecology in healthy land management.
