

Research and Independent Non-Governmental Organizations (RINGO)

- RINGO members provide a range of evidence-based and independent views, with a common focus on the science-policy interface.
- Scientific evidence shows that integrated approaches are beneficial for effectively tackling cross-cutting global challenges and breaking down policy silos.
- Science supports action. Abundant evidence indicates that agriculture can be a central component of an integrated response to climate change.
- The IPCC supports interventions across the food system, from production to consumption.
- Integrated measures can benefit smallholder farmers, who are disproportionately affected by climate change.
- RINGO's Agriculture Thematic Group is working to provide a platform for knowledge sharing and collaboration in topics relating to agriculture and food systems, food and nutrition security, agroforestry and sustainable nutrient management.
- We encourage Parties and Non-Parties to contact RINGO. RINGO organisations are eager to provide evidence that can ultimately translate into actionable solutions to protect the future of people, animals and the planet.
