

Dear Art.6.4 Design Team,

From the 6.2 experience site - You are far too deep in the theoretical weeds. Key to a functional market is to define a very very very simple to use approach that gives a highly predictable number of ITMOs & keep project development paper work cost to the absolute minimum. Make sure it is far lower than the real reductions, without trying to specify how much of the "far lower" is for leakage and what not. Maybe do that simplification and standardization work for technologies you already know will come in large numbers in the first wave of project requests instead of trying to define general rules on how to be conservative all different kinds of carbon projects?

with kind regards
