

TECNOFILTRO SCS

Monday to Friday from 8 am to 5 pm, José Ma.

Address: Larroque 1325, Nueva, 21100 B.C.

Tel. 686 1 94 77 09

June 18, 2023.

Our company TecnoFiltro SCS is a new solution to combat air pollution that is generated by cars, industry, CO2 production sources thanks to its natural chemical formula. Tecnofiltro SCS is a New System that allows to capture toxic gases that are thrown into the environment daily by the different sectors. Air purification systems allow to transform smog into clean air through a "natural chemical" process, it has a certification (NOM-043-semarnat-1993). The technology used is totally innovative this was thrown by the patent process that is being carried out, the SCS formula is not found in another Emission Control System worldwide. Our process is semi-industrial and artisanal, we have a workshop in the City of Mexicali Baja California.

The chemical formula we use is unique in the market, since it is an innovative creation and there is no other with the characteristics we offer as manufacturers of this product, we are the first to produce and sell this technology and provide purifying agents with high quality to the Society. 1,400 kg of activated carbon is required to purify 100% of the toxic gases of a cigarette if it is subjected to a

controlled environment where it is sucked by a compressor that generates a pressure of 10 CFM (cubic feet per minute)

With the chemical formula "SCS" only 75 gr is required. To purify 100% of the smog. The TecnoFiltro SCS solution is functional for everyone equally since as living beings we require a good standard of air quality to keep us alive and healthy.

SCS technology favors us in a positive way in every way, that is, it helps us to control the smog generated by the sources of contamination also helps us with the control of unpleasant odors, our Systems also help to capture viruses and bacteria suspended in the environment, thanks to its composition allows to catch particles pm 2.5 pm, 10 nanoparticles, microparticles and subatomic particles. Our customers are currently completely pleased with the results obtained in their businesses or companies, thanks to our anti-smog systems they and the community in general benefit. Normally the pollution problems vary from the lack of control of gases that they throw into the atmosphere so they come to our services to give you their solution at low cost and with a high efficiency. Currently our company has managed to implement the TecnoFiltro SCS in different sectors of environmental pollution such as the industrial sector, restaurant among other places. Thanks to scs technology, a positive change has been achieved in the city since our systems allow the highest levels of air purification. The sectors where air filters have been installed to date continue to give excellent results, this is thanks to the high absorption efficiency of polluting particulate matter, its natural chemical composition that was specially designed to capture any toxic gas.

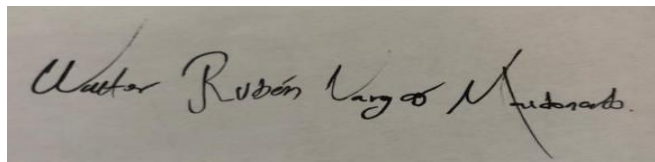

TecnoFiltro scs is a new pollutant emission control system that provides us with a high efficiency alternative, obtaining the highest quality standards has a natural chemical formulation that allows an air purification of 99.95% its design is unique and original which creates a better flow of gases thanks to its internal shape the pressure flow remains stable is less dense than a catalyst which allows the fuel

savings by 15% in standard cars and 8% in automatic cars, we have 2 models for cars that have catalyzing and for those that do not have since their components change.

Our company offers the most sophisticated products in the area of engineering since we have professionals in the area of chemistry, research and technology. The "technofilters" are an avant-garde solution in the elimination of toxic gases since their agents are natural and durable no other chemical formula has them this was revealed by the "IMPI" Instituto Mexicano de la Propiedad Industrial.

The Norma Oficial Mexicana - 043 SEMARNAT -1993 certification yielded the highest quality standards in air purification. The chemical formula comes in different presentations and its use is varied since it can be used in the automotive, industrial and restaurant sectors.

The fundamental objective of TecnoFiltro SCS, is to impact our society worldwide with a new technology that favors the reduction of air pollution levels, through an innovative product created with natural organic matter.
