

Organe subsidiaire de conseil scientifique et technologique

Quarante-troisième session

Paris, 1^{er}-4 décembre 2015

Point 3 de l'ordre du jour provisoire

**Programme de travail de Nairobi sur les incidences
des changements climatiques et la vulnérabilité
et l'adaptation à ces changements**

**Bonnes pratiques et enseignements à retenir concernant
les processus de planification de l'adaptation qui intéressent
les écosystèmes, les établissements humains, les ressources
en eau et la santé, et concernant les processus et les structures
propres à relier la planification de l'adaptation au niveau
national et au niveau local : synthèse des études de cas**

Note du secrétariat*

Résumé

Le présent document récapitule les renseignements figurant dans 170 études de cas communiquées par les Parties et les organisations partenaires du Programme de travail de Nairobi sur les incidences des changements climatiques et la vulnérabilité et l'adaptation à ces changements concernant : 1) les outils et les méthodes existants et appliqués pour la planification de l'adaptation concernant les écosystèmes, les établissements humains, les ressources en eau et la santé; 2) les bonnes pratiques et les enseignements à retenir quant aux processus de planification de l'adaptation, notamment en matière de suivi et d'évaluation, s'agissant des quatre domaines thématiques abordés; 3) les bonnes pratiques et les enseignements à retenir quant aux processus et aux structures propres à relier la planification de l'adaptation au niveau national et au niveau local. En outre, le document indique les prochaines mesures qui pourraient être prises compte tenu des problèmes et des lacunes apparus dans les études de cas.

* Le présent document a été soumis après la date limite en raison des délais nécessaires pour coordonner les apports des nombreux experts et partenaires qui ont contribué aux études de cas et au présent document de synthèse.

I. Résumé

A. Mandat

1. À sa quarantième session, l'Organe subsidiaire de conseil scientifique et technologique a chargé le secrétariat, agissant sous la conduite de son président, et en collaboration avec le Comité de l'adaptation et le Groupe d'experts des pays les moins avancés, et avec les organisations partenaires concernées du Programme de travail de Nairobi sur les incidences des changements climatiques et la vulnérabilité et l'adaptation à ces changements, dont les centres et les réseaux régionaux, d'établir, selon qu'il conviendrait, des études de cas faisant ressortir les éléments ci-après, pour examen à sa quarante-troisième session¹ :

a) Outils et méthodes existants et appliqués pour les processus de planification de l'adaptation intéressant les quatre questions suivantes : écosystèmes, établissements humains, ressources en eau et santé;

b) Bonnes pratiques et enseignements à retenir quant aux processus de planification de l'adaptation, notamment en matière de suivi et d'évaluation, s'agissant des quatre questions susmentionnées;

c) Bonnes pratiques et enseignements à retenir concernant les processus et les structures propres à relier la planification de l'adaptation au niveau national et au niveau local.

B. Contexte

2. À sa dix-neuvième session, la Conférence des Parties (COP) a décidé de poursuivre le Programme de travail de Nairobi conformément aux dispositions de la décision 2/CP.11, en examinant les besoins en connaissances découlant du Cadre de l'adaptation de Cancún et d'autres secteurs d'activité pertinents et organes visés par la Convention et les besoins en connaissances indiqués par les Parties². La COP a aussi demandé au SBSTA d'examiner, dans le cadre du Programme de travail de Nairobi, les domaines thématiques des écosystèmes, des établissements humains, des ressources en eau et de la santé³.

3. Conformément à la décision 17/CP.19, le SBSTA est convenu, à sa quarantième session, d'une série d'activités à mener dans le cadre du Programme de travail de Nairobi pour 2015 afin que des renseignements et des connaissances puissent être recueillis, analysés et diffusés pour éclairer la planification et les mesures dans le domaine de l'adaptation sur les plans régional, national et local concernant les écosystèmes, les établissements humains, les ressources en eau et la santé, notamment⁴.

C. Objet de la note

4. Le présent document fait la synthèse de 170 études de cas⁵ communiquées par les Parties et les organisations partenaires du Programme de travail de Nairobi, y compris les centres et réseaux régionaux. Les experts thématiques des organisations

¹ FCCC/SBSTA/2014/2, par. 20 et 24.

² Décision 17/CP.19, par. 1.

³ Décision 17/CP.19, par. 5.

⁴ FCCC/SBSTA/2014/2, par. 19.

⁵ Reçues par le secrétariat au 18 juin 2015.

partenaires du Programme de travail de Nairobi ont contribué à la vérification du présent document pour en garantir la fidélité factuelle aux études de cas originales⁶.

5. On trouvera à la section D ci-après un aperçu général des études de cas, y compris leur répartition par domaine thématique et par région. Les sections E à H proposent une synthèse des renseignements figurant dans les études de cas, chacune abordant un domaine thématique (écosystèmes, établissements humains, ressources en eau et santé, respectivement). Chacune de ces sections propose une vue d'ensemble du domaine thématique, des outils et des méthodes utilisés dans les processus de planification de l'adaptation, et des bonnes pratiques et des enseignements dégagés^{7, 8}. La section I présente une synthèse des bonnes pratiques de suivi et d'évaluation recensées dans les quatre domaines thématiques visés au paragraphe 2 ci-dessus. La section J analyse les études de cas qui concernent les processus et les structures propres à relier la planification de l'adaptation au niveau national et au niveau local. La section K conclut cette vue d'ensemble en indiquant les mesures ultérieures possibles, et présente aussi des éléments d'information qui seraient utiles aux praticiens et aux décideurs dans le domaine de l'adaptation compte tenu des lacunes et des difficultés recensées.

D. Aperçu général des études de cas

6. En tout, 170 études de cas ont été communiquées par les Parties et les organisations partenaires du Programme de travail de Nairobi, conformément au mandat indiqué au paragraphe 1 ci-dessus et comme suite à l'invitation formulée par le secrétariat. Parmi ce nombre, 47 ont été présentées par 21 Parties et 123 par 43 organisations partenaires du Programme de travail de Nairobi. Sur les 170 études de cas, 153 sont axées sur les domaines thématiques mentionnés au paragraphe 2 ci-dessus et 17 sont axées sur les processus et les structures propres à relier la planification de l'adaptation au niveau national et au niveau local.

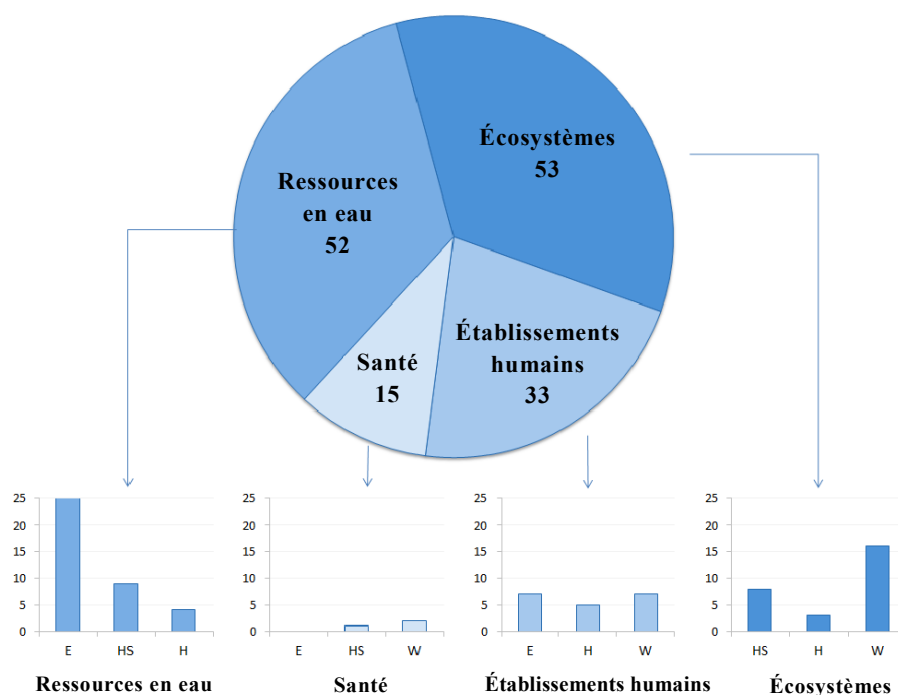

7. Si la plupart des 153 études de cas thématiques abordent plus d'un thème, un domaine thématique principal a été recensé pour chaque étude de cas aux fins de l'analyse. Dans la mesure où la plupart des études de cas ont porté sur plus d'un thème, les thèmes secondaires sont illustrés dans la figure 1 ci-après, qui montre la répartition des thèmes principaux et des thèmes secondaires dans les études de cas.

⁶ Des experts des organisations ci-après ont examiné la version préliminaire du présent document : Alliance for Global Water Adaptation, Partenariat mondial pour l'eau, Union internationale pour la conservation de la nature, Institut international de l'eau à Stockholm, Programme des Nations Unies pour les établissements humains, Programme des Nations Unies pour l'environnement, Centre mondial de surveillance de la conservation de la nature et Organisation mondiale de la Santé.

⁷ Les bonnes pratiques mentionnées dans la synthèse sont notamment les processus et les structures qui : 1) favorisent particulièrement la participation; 2) tiennent compte des connaissances traditionnelles, autochtones et locales; 3) utilisent le suivi et l'évaluation pour permettre une planification itérative de l'adaptation; 4) constituent des exemples concrets provenant des études de cas. La partie consacrée aux enseignements souligne et récapitule les facteurs de succès ainsi que les difficultés, sans renvoyer expressément à des exemples; les constatations présentées ici se fondent davantage sur une évaluation globale des études de cas pour chaque domaine thématique.

⁸ On notera que si toutes les études de cas figurant à l'annexe I ne sont pas mentionnées dans le corps du document, il a été tenu compte de tous les renseignements utiles provenant des études de cas pour compiler les bonnes pratiques et les enseignements. Autant que possible, des exemples tirés d'un certain nombre d'études de cas ont été utilisés pour illustrer les bonnes pratiques.

Figure 1
Répartition des études de cas par domaine thématique

Note : 1) La figure tient compte uniquement des 153 études de cas considérées comme thématiques; 2) le graphique à secteurs indique le domaine thématique principal abordé (le nombre d'études de cas étant indiqué sous chaque thème) et les graphiques à bâtons indiquent les domaines thématiques secondaires traités pour chaque thème principal (le nombre d'études de cas étant indiqué par l'axe des ordonnées).

8. Les 17 études de cas axées sur les processus et les structures propres à relier la planification de l'adaptation au niveau national et au niveau local ont aussi abordé les ressources en eau (12), les établissements humains (11), les écosystèmes (10) et la santé (9). Parmi les 170 études de cas au total, 127 ont donné des renseignements sur la planification de l'adaptation en cours et 43 sur des mesures achevées.

9. La prise en considération des connaissances autochtones et traditionnelles a figuré dans 33 études de cas. Il a été question de démarches soucieuses de l'égalité entre les sexes ou des rôles différents des hommes et des femmes dans 36 études de cas. Des renseignements ont été communiqués sur le suivi et l'évaluation dans 116 études de cas.

10. La plupart des études de cas sont centrées sur l'Asie et l'Afrique. La figure 2 indique la répartition des études de cas par région.

Figure 2
Répartition des études de cas par région et autres catégories
 (Nombre d'études de cas)

11. Un code a été attribué à chaque étude de cas (voir l'annexe I pour le code, le titre et les autres renseignements relatifs à chaque étude de cas, et l'annexe II pour les outils et les méthodes associés à chaque étude de cas; chacune des annexes est organisée par domaine thématique). Tout au long du document, selon qu'il convenait, les études de cas ont été désignées par ces codes (dans les notes de bas de page principalement).

E. Synthèse des renseignements concernant les écosystèmes

1. Aperçu général

12. Les études de cas au sujet des écosystèmes ont souligné que les changements climatiques altèrent les écosystèmes, leurs fonctions et les nombreux avantages et services qu'ils apportent à la société. Les études de cas ont établi que les écosystèmes

sont complexes et interdépendants; qu'ils évoluent et changent au fil du temps; que les changements climatiques sont l'un des principaux facteurs de changement des écosystèmes à long terme. Les études de cas ont indiqué, dès lors, que les processus d'adaptation concernant les écosystèmes doivent intervenir à des échelles spatiales et temporelles appropriées.

13. Les études de cas ont présenté des activités d'adaptation qui répondent à un certain nombre de risques liés au climat, parmi lesquels :

a) La sécheresse (36), liée à l'aridité estivale accrue qui réduit la disponibilité de l'eau, diminue la productivité des zones de parcours et augmente les risques d'incendie dans les forêts, les zones arides, les zones de culture et les prairies;

b) Les inondations (27), qui se soldent par une augmentation des glissements de terrain, et un retrait des glaciers dans les écosystèmes montagneux et les eaux intérieures;

c) Le décalage des saisons (24), lié à la modification des systèmes marins qui résulte de changements climatiques à grande échelle.

2. Outils et méthodes

14. Divers outils et méthodes ont été conçus et appliqués pour les processus de planification de l'adaptation concernant les écosystèmes. Des outils et méthodes ont été élaborés pour recenser et évaluer des options d'adaptation, et des cadres, des outils et des indicateurs ont été élaborés pour le suivi et l'évaluation des mesures d'adaptation.

15. Les études de cas ont souligné qu'une séparation théorique entre l'adaptation fondée sur les écosystèmes et l'adaptation des écosystèmes est nécessaire, tout en tenant compte du rôle plus général que les écosystèmes pourraient jouer dans les stratégies de lutte contre les changements climatiques.

16. Des démarches fondées sur les écosystèmes ont été largement appliquées aux fins de l'adaptation pour améliorer la résilience des écosystèmes et pour maintenir et améliorer la qualité et la quantité des services écosystémiques de façon qu'ils puissent aider la société à s'adapter aux changements climatiques.

3. Bonnes pratiques et enseignements

17. Les études de cas ont recensé des bonnes pratiques concernant la réalisation de projets écosystémiques d'adaptation dont on trouvera une sélection ci-après :

a) Une prise des décisions fondée sur la participation qui soit décentralisée au plus bas échelon de responsabilité possible, et soit itérative, ouverte et adaptable, est fondamentale. L'apprentissage interactif et partagé et un processus décisionnel participatif contribuent à renforcer la prise en main au niveau local. Dans tous les exemples fournis à cet égard, le dénominateur commun a été d'établir la confiance et la crédibilité par des mesures coordonnées et participatives avec les principaux intéressés. Les capacités institutionnelles locales peuvent être renforcées et promues en consolidant les acteurs, les institutions et les organes décisionnels sociaux, techniques et politiques existants par des activités ciblées de formation et d'apprentissage mutuel. L'inclusion des femmes et des populations pauvres, vulnérables et marginalisées dans la planification de l'adaptation s'est révélée efficace étant donné leur dépendance directe à l'égard des écosystèmes pour leurs moyens d'existence;

b) L'information et les connaissances de toute origine, y compris la coconstruction du savoir à partir de sources traditionnelles, locales et contemporaines,

devraient être utilisées de sorte que les sensibilités culturelles et sexospécifiques soient prises en considération et qu'une information solide soit rassemblée et validée. Soutenir l'application des connaissances locales peut être utile pour recenser des solutions viables économiquement et socialement (solutions adaptées au contexte local) afin d'améliorer la résilience des systèmes naturels et sociétaux;

c) La participation d'acteurs aussi bien gouvernementaux que non gouvernementaux est fondamentale pour garantir des processus de planification de l'adaptation efficaces;

d) L'intégration et l'inclusion des initiatives pour l'adaptation dans les projets de développement et les stratégies sectorielles peuvent aider à obtenir des financements, à coordonner des plans et des stratégies qui risqueraient autrement d'avoir des incidences négatives sur les initiatives d'adaptation, à améliorer la coordination entre les principales parties prenantes et à faciliter l'application des mesures d'adaptation;

e) La diversification des activités économiques et des modes d'existence contribue à améliorer la résilience des populations. Cette diversification peut aussi contribuer à promouvoir la résilience des écosystèmes en réduisant les facteurs de dégradation;

f) L'apport de ressources financières ne garantit pas une application efficace des mesures d'adaptation s'il ne s'accompagne pas d'un dispositif institutionnel efficace, de mécanismes financiers stables et de services non financiers comme les programmes d'éducation. L'association avec des services non financiers peut jouer un rôle décisif dans le succès de tout dispositif financier.

18. Une série de facteurs contribuant à l'efficacité a été mise en évidence par les études de cas. Ces facteurs sont notamment la participation active des parties prenantes, qui contribue à la confiance accordée au processus de planification de l'adaptation, à sa prise en main et à l'appui dont il bénéficie; l'intégration des connaissances autochtones et scientifiques et la conception conjointe des mesures d'adaptation, qui renforcent les moyens d'action des populations locales; une coordination de haut niveau entre les principaux secteurs, particulièrement utile pour l'intégration des politiques et la mobilisation du financement en faveur des mesures d'adaptation; la coopération transfrontière, qui facilite l'accès aux données et à l'information sur le climat; des options d'adaptation qui soient souples et adaptées aux capacités existantes et à la structure politique à tous les niveaux; et la prise en considération des facteurs de changement qui ne sont pas liés au climat et des déterminants fondamentaux de la vulnérabilité.

19. Un certain nombre de difficultés ont aussi été signalées dans le cadre des études de cas, parmi lesquelles l'investissement en temps important demandé aux parties prenantes, auquel il pouvait être remédié, comme l'ont montré certaines études de cas, par des modèles de participation complets, souples et ouverts; l'accès limité à des données climatiques à échelle réduite pour l'évaluation des risques et de la vulnérabilité, auquel il pouvait être répondu en appliquant une méthode d'évaluation des risques par étapes; la définition de moyens pour mesurer, répartir et échelonner (la détection des effets pouvant prendre du temps) les coûts, pour repérer les effets, pour établir une base de connaissances et pour réaliser un suivi et une évaluation afin de mesurer l'utilité et l'efficacité des politiques d'adaptation. Ces obstacles peuvent être surmontés en veillant à ce que des ressources suffisantes soient allouées au suivi et à l'évaluation, en élaborant des indicateurs du contexte et de l'impact susceptibles de produire l'information nécessaire pour remédier aux lacunes de la base de connaissances et en ayant recours dès le départ au suivi et à l'évaluation.

F. Synthèse des renseignements concernant les établissements humains

1. Vue d'ensemble

20. Les études de cas ont souligné que les changements climatiques, outre d'autres perturbateurs (notamment l'exploitation des ressources naturelles), exercent des effets sur les établissements humains ruraux, urbains et côtiers, dont ils perturbent ainsi les fonctions écologiques, sociales et économiques.

21. Les risques liés au climat qui touchent les établissements humains signalés dans les études de cas sont notamment :

a) L'augmentation des surfaces imperméables dans les établissements humains, conjuguée à une modification du régime des précipitations, se solde par des inondations ou un risque accru d'inondations. Les changements dans l'écoulement des cours d'eau et, du fait de l'urbanisation des rives, les changements dans le régime d'écoulement se soldent par des inondations et des risques accrus d'inondation. Les inondations ont été signalées parmi les principaux risques climatiques dans 29 études de cas;

b) L'élévation du niveau de la mer augmente les risques de crue et d'intrusion des eaux de mer, ce qui expose les établissements côtiers, qu'ils soient de dimensions réduites comme dans les petits États insulaires en développement, ou qu'il s'agisse de mégapoles comme la ville de New York. Les pressions croissantes résultant de la mise en valeur et de l'exploitation des ressources naturelles et la disparition d'écosystèmes protecteurs ne font qu'accroître la vulnérabilité des établissements côtiers. L'élévation du niveau de la mer et les ondes de tempête figurent parmi les principaux risques climatiques dans 21 études de cas;

c) La densification de la population et le manque d'espaces verts en milieu urbain, aggravés par la gravité et la fréquence accrues des canicules, augmentent l'effet d'îlot thermique urbain dans les villes, ce qui détériore la qualité de l'air et expose une plus grande partie de la population aux risques sanitaires liés au climat.

2. Outils et méthodes

22. Divers outils et méthodes ont été conçus et appliqués pour les processus de planification de l'adaptation concernant les établissements humains, notamment des outils pour l'évaluation des risques climatiques à l'intention du secteur privé et des ingénieurs.

3. Bonnes pratiques et enseignements

23. Les études de cas ont recensé des bonnes pratiques pour les processus et les structures propres à favoriser la participation des acteurs, et s'agissant de faciliter les diverses étapes du processus de planification de l'adaptation, qui sont récapitulées ci-après :

a) La collaboration avec le secteur privé et le secteur public au niveau local, notamment dans le cadre de partenariats public-privé, est décisive pour faire en sorte que le processus de planification de l'adaptation débouche sur un apprentissage social transformateur, une acceptation des solutions d'adaptation et des villes et des municipalités résilientes. Les partenariats public-privé contribuent souvent à mobiliser le potentiel des populations locales qui ont une connaissance de première main des conditions climatiques locales;

b) La coconstruction du savoir existant local, traditionnel, écologique et scientifique au moyen de processus ouverts et participatifs contribue à créer des

solutions solides et mutuellement acceptables en évitant les conflits d'intérêts perçus et les problèmes résultant de points de vue différents;

c) Tout en reconnaissant le rôle d'un processus ouvert et participatif dans une planification efficace de l'adaptation concernant les établissements humains, il est également impératif qu'un dirigeant efficace soit en place pour créer et entretenir une dynamique grâce à : l'apport de capitaux; la création d'incitations économiques pour des stratégies vertes; la communication des résultats des bonnes pratiques pour créer un esprit de coopération dans la population; et l'institutionnalisation des bonnes pratiques;

d) L'évaluation, le relevé et la communication des bonnes pratiques offrent un moyen efficace d'améliorer la sensibilisation et de transposer les pratiques à tous les niveaux;

e) La diversification des activités économiques et des moyens d'existence pourrait constituer une approche efficace pour créer des établissements résilients face aux changements climatiques. La mise au point et l'exécution de stratégies locales qui créent des emplois, en particulier des emplois verts, contribuent à mobiliser le secteur public et le secteur privé. Les outils de diversification des moyens d'existence peuvent contribuer à la transformation du processus de développement;

f) Les investissements dans des prototypes techniques peuvent servir de tremplin pour garantir les établissements contre les effets des changements climatiques. Des interventions pilotes simples et peu onéreuses pourraient être utilisées comme précurseurs de mesures qui améliorent la résilience aux changements climatiques, en particulier dans les établissements ruraux et à faible revenu;

g) Pour permettre l'adaptation et la résilience face aux changements climatiques, les interventions doivent être décidées au moyen d'un processus de planification éclairé et itératif avec la participation de toutes les parties prenantes.

24. Les études de cas ont mis en évidence une série de facteurs qui ont une incidence sur l'efficacité, parmi lesquelles : des partenariats public-privé efficaces; l'intégration de l'adaptation aux changements climatiques dans les processus de planification sectorielle et de planification du développement ou sa coordination avec ces processus; l'accès à des données et des informations solides et contextualisées sur le climat et dans d'autres domaines scientifiques; la coproduction de connaissances étayée par des activités efficaces de formation, de formation continue et de communication des résultats et des conclusions aux détenteurs de connaissances.

25. L'amélioration des capacités d'adaptation et la réduction de la vulnérabilité de la population la plus exposée, l'utilisation de prototypes de mesures d'adaptation innovants et à faible coût, l'exploitation des connaissances et des ressources locales, et la création d'incitations économiques dans le cadre des solutions d'adaptation font partie des principaux éléments à prendre en considération pour créer des établissements résilients.

26. Les études de cas ont signalé également un certain nombre de difficultés, parmi lesquelles : le décalage entre les travaux de recherche et les besoins opérationnels des utilisateurs; l'importance insuffisante accordée dans les mesures d'adaptation aux habitants les plus pauvres des établissements humains, qui sont souvent les plus exposés ou les plus vulnérables aux aléas climatiques; et l'insuffisance des instruments financiers et des ressources financières.

G. Synthèse des informations relatives aux ressources en eau

1. Aperçu

27. Compte tenu du lien intrinsèque qui existe entre les ressources en eau, qu'elles soient intérieures ou non, et les autres secteurs et écosystèmes, de la sensibilité du cycle de l'eau aux changements climatiques et des grandes difficultés à prévoir son évolution grâce à des modèles climatiques, ainsi que du temps (des dizaines d'années, voir des siècles) que prennent les interventions en matière de gestion de l'eau, les études de cas sur les ressources en eau ont montré que les changements climatiques aggravent la vulnérabilité des ressources en eau. La disponibilité et l'accessibilité (quantité) de ces ressources et leur dégradation (qualité) sont influencées par les changements climatiques, qui ont des effets néfastes sur : les écosystèmes et la biodiversité; l'agriculture et la sécurité alimentaire; l'utilisation des terres et la foresterie; l'approvisionnement en eau et l'assainissement; la santé; les agglomérations et les infrastructures urbaines. Les conséquences pour la disponibilité et l'accessibilité des ressources en eau au niveau régional pourraient provoquer des crises régionales de l'eau, engendrant déstabilisations et conflits économiques, qui toucheraient davantage les populations pauvres et vulnérables.

2. Outils et méthodes

28. Divers outils et méthodes ont été mis au point et appliqués aux processus de planification de l'adaptation portant sur les ressources en eau, notamment des directives et des cadres d'évaluation des risques utilisés pour déterminer les risques que la vulnérabilité des ressources en eau aux changements climatiques fait courir à d'autres secteurs (par exemple, l'infrastructure, l'énergie, l'agriculture, les écosystèmes).

3. Bonnes pratiques et enseignements à retenir

29. Les études de cas ont recensé de bonnes pratiques en ce qui concerne les processus de planification de l'adaptation appliqués aux ressources en eau, notamment :

a) La bonne adéquation des institutions, des plans et des politiques au niveau local et national favorise l'identification et l'intégration de ripostes efficaces face aux risques induits par le climat;

b) Compte tenu du caractère transfrontalier des ressources en eau qui touchent des communautés de différents pays et régions à tous les niveaux, un processus participatif et structuré qui associe les acteurs au niveau de responsabilité le plus bas aide à gérer les conflits et à promouvoir la maîtrise des interventions d'adaptation. Un mélange de mesures descendantes et ascendantes (du niveau transfrontalier ou international au niveau régional, national et local) est bénéfique dans ce contexte. Des directives et cadres bilatéraux pourraient aussi insuffler la volonté politique nécessaire et aider à accéder aux ressources financières;

c) Les processus participatifs et itératifs de planification et d'évaluation des options en matière d'adaptation, notamment l'évaluation des priorités et des compromis, jouent un rôle clef en vue de concevoir les interventions d'adaptation en fonction du contexte et d'éviter les risques de mauvaise adaptation. Un processus itératif d'apprentissage mutuel, des méthodes participatives et une approche descendante garantissent que les acteurs prennent une part active à la définition de stratégies appropriées de gestion des bassins hydrographiques;

d) Les partenariats public-privé pourraient contribuer au succès grâce à un processus de prise de décisions décentralisé;

e) Les systèmes financiers novateurs permettent de trouver des solutions novatrices;

f) Les évaluations des incidences des changements climatiques et les analyses des risques climatiques pour les ressources en eau qui revêtent un caractère participatif, interdisciplinaire et systématique aident à la prise de décisions relatives aux interventions d'adaptation qui tiennent compte des facteurs socioéconomiques et environnementaux;

g) Les décisions concernant la planification, la conception, le financement et le fonctionnement des infrastructures hydriques sont souvent prises dans un contexte de grande incertitude. Les investissements dans les infrastructures hydriques doivent tenir compte des risques à la fois actuels et futurs à tous les stades de développement pour que ces infrastructures soient solides et résilientes aux changements climatiques;

h) La coproduction de savoir débouche sur des solutions d'adaptation économiques et appropriées au niveau local. Les projets de démonstration jouent un rôle essentiel en confirmant leurs effets bénéfiques et en incitant à adopter plus largement ce type de projet et à les développer;

i) Le renforcement des capacités locales d'adaptation destinées à préserver les moyens de subsistance est un bon point de départ pour une participation réelle des communautés en matière de sécurité de l'approvisionnement en eau;

j) Les solutions de diversification des moyens de subsistance inspirent les engagements pris et les mesures mises en œuvre au niveau local en faveur de la résilience.

30. Un certain nombre de facteurs qui influent sur le succès sont ressortis des études de cas, à savoir : un cadre juridique et institutionnel rationnel et un système de gouvernance souple et réactif; des connaissances scientifiques partagées; un mandat et un engagement politique clairs et forts; une coordination intersectorielle de la gestion des ressources en eau transfrontalières. Le renforcement des capacités et la coproduction de connaissances scientifiques, locales et autochtones étaient aussi considérés comme des facteurs de succès.

31. Les études de cas ont également fait ressortir un certain nombre de problèmes, à savoir : le manque de volonté politique, les insuffisances de la structure institutionnelle locale (ou appropriation locale) et l'absence d'engagement financier des pays partageant des ressources en eau transfrontalières, qui entraînent un manque de coordination pour réduire la vulnérabilité. L'investissement en temps, qui est souvent essentiel dans l'instauration de partenariats de collaboration pour la gestion des ressources en eau, était souvent cité au nombre des difficultés.

H. Synthèse des informations relatives à la santé

1. Aperçu

32. Les études de cas portant sur la santé ont montré que les changements climatiques aggravent les déterminants environnementaux de la santé, notamment en raison du risque que ces changements climatiques font peser sur les ressources en eau, les infrastructures et l'assainissement, mettant gravement en danger les sociétés, surtout les groupes vulnérables (par exemple, les personnes âgées, les nourrissons et les jeunes enfants, les malades chroniques et les personnes travaillant à l'extérieur).

33. Les études de cas ont indiqué que les risques liés au climat qui touchent la santé sont les suivants :

a) La plus grande fréquence et intensité des phénomènes climatiques extrêmes tels que les inondations, les cyclones et les sécheresses, les changements

météorologiques et les températures extrêmement chaudes (telles que les vagues de chaleur), aggravent le risque de maladie et de mort liés à ces menaces;

b) L'élévation du niveau des mers, l'intrusion d'eau de mer et les inondations côtières peuvent favoriser la propagation des moustiques, exacerbant le risque de survenue de maladies transmises par l'eau telles que la fièvre de dengue et le paludisme. L'élévation du niveau des mers a été considérée comme un risque climatique essentiel dans sept études de cas.

c) La sécheresse accroît la fréquence des maladies liées à l'alimentation. Elle a été qualifiée de risque climatique majeur dans dix études de cas.

2. Outils et méthodes

34. Un certain nombre d'outils et de méthodes ont été mis au point et appliqués à l'évaluation des risques et de la vulnérabilité, à la planification de l'adaptation ainsi qu'au suivi et à l'évaluation, notamment des cadres méthodologiques qui favorisent la tenue d'un processus itératif comportant diverses étapes allant de l'identification initiale des risques à la mesure des progrès accomplis par les activités d'adaptation.

3. Bonnes pratiques et enseignements à retenir

35. Les bonnes pratiques citées dans les études de cas concernent les processus, structures et démarches qui incitent les acteurs à participer et sont aussi celles qui permettent de franchir les étapes du processus de l'adaptation :

a) Compte tenu des relations étroites et interdépendantes entre la santé et les autres secteurs tels que les transports, l'énergie, les ressources en eau, la sécurité alimentaire et l'agriculture, ainsi que les établissements humains, des mécanismes multisectoriels solides associant des acteurs interdisciplinaires aux niveaux national et infranational incitent à rendre les services de santé résilients aux changements climatiques;

b) Des processus participatifs qui associent des populations locales et des autochtones contribuent souvent à l'appropriation et au renforcement des capacités institutionnelles locales d'obtenir des résultats qui sont tangibles et appropriés au niveau local;

c) Des structures de financement novatrices et souples aident à décentraliser les responsabilités jusqu'à l'échelon le plus bas;

d) La coproduction de connaissances scientifiques, locales et autochtones permet de répondre aux besoins et priorités des communautés;

e) L'intégration des risques de santé liés au climat dans les politiques et plans nationaux et sectoriels débouche sur la mise en place de systèmes de santé résilients aux changements climatiques.

f) L'établissement et la diffusion de données attestant des bénéfices pour la santé (par exemple, la diminution des incidences sur la santé et du coût des soins de santé) et des retombées bénéfiques sur les autres secteurs (par exemple, la sécurité de l'approvisionnement en eau) des mesures d'adaptation pourraient aider à renforcer l'appropriation locale et politique des mesures relatives à la santé;

g) La collecte et la diffusion d'informations et de connaissances concernant les incidences des changements climatiques sur la santé, des évaluations de la vulnérabilité et de l'adaptation, ainsi que des plans et des mesures d'adaptation permettent de constituer un réservoir important de savoir et contribuent à amplifier et diffuser les bonnes pratiques.

36. Les études de cas ont recensé un certain nombre de facteurs et de considérations qui pourraient contribuer à une adaptation efficace traitant les incidences des changements climatiques sur la santé, à savoir : le renforcement de la participation et des capacités des acteurs compétents dans différents secteurs et à différents niveaux; l'adoption d'un processus itératif qui permet un apprentissage permanent, l'évaluation des besoins en évolution et le renforcement des capacités des communautés, l'intégration des risques liés aux changements climatiques et la nécessité d'intégrer l'adaptation et ses incidences connexes sur les ressources dans les processus plus larges d'élaboration des politiques et de planification aux niveaux sectoriel et national; l'identification et l'adoption de solutions technologiques susceptibles de produire des effets bénéfiques généralisés.

37. Les efforts visant à s'adapter aux incidences des changements climatiques dans le domaine de la santé ont été entravés par les éléments suivants, entre autres : les lacunes en matière de prise de conscience, de connaissance et de compréhension des effets potentiels sur la santé; les capacités techniques d'analyse des risques et de planification d'une adaptation efficace; les ressources financières, y compris celles qui garantissent une participation constante des acteurs locaux et communautaires et celles qui investissent dans des solutions technologiques importantes et efficaces. Mais des travaux sont menés pour lever ces obstacles, notamment pour permettre à des experts internationaux de traiter les obstacles liés aux capacités techniques, et l'adoption d'une structure de financement souple et décentralisée qui donne aux communautés locales et vulnérables les moyens de déterminer comment utiliser au mieux les ressources financières mises à disposition par les autorités à un niveau plus élevé.

I. Bonnes pratiques en matière de suivi et d'évaluation

38. Les bonnes pratiques ci-après, relatives au suivi et à l'évaluation de l'adaptation dans les quatre domaines thématiques mentionnés au paragraphe 2 ci-dessus, sont ressorties des études de cas :

a) Les systèmes participatifs de suivi et d'évaluation utilisés dans certaines des études de cas sont utiles pour entretenir les capacités d'adaptation des communautés et pour aider à mettre en place des processus participatifs de suivi qui associent des communautés locales et autochtones, et renforcent le processus d'évaluation;

b) La prise en compte du suivi des effets bénéfiques sur les moyens de subsistance dans des démarches intégrées qui vont au-delà du recensement fondamental des incidences sur la réduction de la vulnérabilité peut aider à fournir des informations susceptibles de contribuer à l'amplification de telles démarches et de démarches non contraignantes qui produisent aussi des incidences bénéfiques tangibles sur l'atténuation des changements climatiques et l'adaptation à leurs effets⁹;

c) Les processus itératifs d'adaptation jouent un rôle essentiel dans l'évaluation et la modification des plans et des mesures compte tenu des risques climatiques futurs et des informations y relatives. Les cadres et processus prospectifs et itératifs permettent d'évaluer et d'améliorer les activités;

d) Les systèmes factuels assortis d'indicateurs mesurables sont utiles pour suivre l'avancement des interventions d'adaptation et amplifier les bonnes pratiques. L'élaboration d'indicateurs attribuables à un niveau de référence aide à évaluer l'avancement des mesures d'adaptation.

⁹ IUCNE15.

J. Synthèse des informations relatives aux processus et structures propres à relier la planification de l'adaptation au niveau national et au niveau local

1. Aperçu

39. Étant donné que les effets des changements climatiques se font ressentir dans plusieurs secteurs et à plusieurs niveaux, et compte tenu de la disparité entre l'importance des mesures locales d'adaptation et de la concentration des ressources financières et techniques au niveau national, il est particulièrement pertinent et important de relier la planification de l'adaptation au niveau national et au niveau local pour une action efficace.

2. Outils et méthodes

40. Les études de cas portant sur le lien entre la planification de l'adaptation au niveau national et au niveau local ont recensé un certain nombre de méthodes et d'outils tels que des lignes directrices, qui appuient la prise de décisions en matière d'adaptation à différents niveaux.

41. Un cadre global reposant sur des indicateurs locaux qui peuvent être étendus aux niveaux infranational et national pourrait être un instrument efficace d'évaluation de l'impact global des mesures locales à l'échelon national, et peut ainsi alimenter la base de données factuelles.

3. Bonnes pratiques et enseignements à retenir

42. Plusieurs bonnes pratiques sont ressorties en ce qui concerne la participation des acteurs et divers processus et structures propres à relier la planification de l'adaptation au niveau national et au niveau local :

a) Le renforcement des cadres institutionnels nationaux et locaux favorise les transformations et aide à reproduire les bonnes pratiques;

b) L'apport de ressources financières ou l'accès direct aux fonds permet de relier plus facilement la planification de l'adaptation au niveau national et au niveau local. L'intégration des considérations relatives à l'adaptation aux changements climatiques dans les processus de planification du développement des autorités et des administrations locales à l'échelon sectoriel contribue à renforcer le lien entre les deux niveaux;

c) La promotion de la coproduction de connaissances par le biais d'un processus participatif, multidisciplinaire et structuré stimule fortement l'harmonisation des démarches descendantes et ascendantes et ces processus aident aussi à prendre en compte la dimension multisectorielle des changements climatiques dans les mesures d'adaptation;

d) Le partage des connaissances et l'apprentissage à tous les niveaux et dans de multiples secteurs nourrit les processus de planification de l'adaptation aux niveaux national et local.

43. Les études de cas ont fait ressortir un certain nombre de facteurs qui concourent à relier de manière efficace la planification de l'adaptation au niveau national et au niveau local, à savoir : le renforcement des capacités institutionnelles; la reconnaissance et la mise à profit des réseaux et partenariats existants; la mise en œuvre de processus et stratégies structurés pour le partage des connaissances et l'apprentissage entre acteurs à différents niveaux; la collaboration avec les réseaux et plateformes existants de la société civile; l'allocation de fonds et l'accès au financement afin de bien relier les politiques et processus nationaux aux

connaissances et mesures locales; la promotion de la coproduction de connaissances visant à harmoniser les approches descendantes et ascendantes en matière de savoir et à permettre une approche intégrée intersectorielle de l'adaptation.

44. Parmi les principaux obstacles à une bonne relation entre le niveau national et le niveau local de la planification de l'adaptation qui ressortent des études de cas figurent l'insuffisance des capacités, l'inadéquation des structures ou mécanismes de coordination nationale et l'absence de directives précises. Mais des efforts sont faits pour y remédier, notamment dans le cadre du processus de formulation et d'application de plans nationaux d'adaptation (PNA) afin de renforcer la capacité des institutions publiques et de faciliter la coordination de la planification et des pratiques en matière d'adaptation à différents niveaux.

K. Conclusions et prochaines étapes

45. Certains éléments communs se sont dégagés des processus de planification de l'adaptation portant sur les écosystèmes, les établissements humains, les ressources en eau et la santé, ainsi que le lien entre le niveau national et le niveau local de la planification de l'adaptation. La présente section illustre les principaux éléments communs, notamment les lacunes en matière de communication et de diffusion d'informations et de connaissances, qui pourraient être considérés comme un point de départ pour de nouvelles étapes éventuelles, dans le cadre du Programme de Nairobi.

46. Les sections I.E-H démontrent les liens entre les écosystèmes – au niveau des espèces, de la diversité génétique au sein des espèces et des interactions écologiques – et les ressources en eau, la santé et les établissements humains, étayant ainsi l'idée selon laquelle la planification et les pratiques en matière d'adaptation recoupent souvent plusieurs thèmes et produisent des effets bénéfiques dans plus d'un domaine thématique. Par exemple, les études de cas ont reconnu que des écosystèmes sains renforçaient la résilience des communautés et aidaient les populations à s'adapter aux changements climatiques en assurant un large éventail de services qui contribuent au bien-être. Les établissements humains attestent aussi d'un lien avec les autres domaines thématiques, notamment les ressources en eau, les services environnementaux et la santé.

47. S'agissant de l'intégration des stratégies et outils intégrant une perspective de genre et des connaissances autochtones et traditionnelles, les principaux messages qui se sont dégagés sont les suivants :

a) Il est important de produire et d'utiliser des informations et des connaissances provenant de toutes les sources, notamment d'associer des sources scientifiques traditionnelles, locales et contemporaines, de prendre en compte les sensibilités liées à la culture et au genre, et de s'assurer que toutes ces informations sont complètes et validées, si possible, grâce à un processus systématique. De tels processus d'association aident à autonomiser les communautés locales, à promouvoir une compréhension commune de ces questions et à renforcer la capacité des communautés de mettre en œuvre des mesures d'adaptation;

b) Les processus participatifs qui associent tous les membres des communautés (notamment les hommes, les femmes et les autochtones) contribuent souvent à l'appropriation, ainsi qu'au développement et au renforcement des capacités institutionnelles locales de produire des résultats de manière efficace appropriée au niveau local. Il est donc primordial d'avoir des échanges d'informations et de connaissances entre tous les membres de la communauté, les scientifiques et les décideurs afin d'éclairer le processus de prise de décisions et de le rendre plus participatif.

48. Bien que certaines études de cas aient donné des exemples de bonnes pratiques, un certain nombre de lacunes et de problèmes existent en ce qui concerne la communication, la constitution et la diffusion d'informations et de connaissances, notamment concernant les partenariats de collaboration à de multiples niveaux, en vue d'amplifier les mesures d'adaptation ayant trait aux quatre domaines thématiques mentionnés au paragraphe 2 ci-dessus. Les questions relatives aux connaissances et aux informations que les professionnels de l'adaptation et les décideurs pourraient prendre en compte en fonction des lacunes et les difficultés rencontrées sont les suivantes :

a) Il est essentiel de diffuser les constatations scientifiques des incidences locales des changements climatiques au niveau régional. S'il est important de produire de bonnes données scientifiques, il est essentiel d'en communiquer les résultats. Les outils de communication jouent un rôle clef et doivent être adaptés aux acteurs et aux destinataires;

b) La collecte et la diffusion d'informations et de connaissances à tous les niveaux et entre de multiples acteurs sont propres à éclairer les processus de planification et d'adaptation aux niveaux national et local. La collecte et la diffusion d'informations et de connaissances sur les incidences des changements climatiques ayant trait à divers thèmes, aux évaluations de la vulnérabilité et de l'adaptation, ainsi qu'aux plans et mesures d'adaptation, constituent une base importante de savoir et contribuent à amplifier et à faire connaître les bonnes pratiques;

c) La coproduction de connaissances (à savoir, scientifiques, locales et traditionnelles) n'est efficace que si elle est complétée par une formation efficace, un apprentissage permanent et la communication des résultats des projets et des pratiques d'adaptation aux détenteurs de savoir;

d) La planification de l'adaptation et les mesures y relatives qui sont souples et s'ajustent à la capacité et à la structure politique à tous les niveaux ont débouché sur une acceptation accrue de la nécessité de répondre aux besoins en évolution et sur une capacité accrue de le faire. La souplesse et la capacité d'ajustement peuvent être assurées au mieux lorsque les plans et priorités d'adaptation se fondent sur les connaissances factuelles pour établir la variabilité actuelle et les incidences à venir, les dispositifs institutionnels, le contexte sociopolitique et les capacités à différents niveaux et lorsque sont en place des mécanismes d'examen réguliers qui tiennent compte des nouvelles connaissances, d'effets imprévus et de l'évolution des capacités. Par exemple, il est utile d'expliquer les liens entre les projets d'écosystème et d'adaptation et les priorités, plans, programmes, stratégies et politiques au niveau national, notamment le processus de formulation et de mise en œuvre des PNA;

e) Le processus de formulation et d'exécution des PNA au titre du cadre de l'adaptation de Cancún offre aux pays une occasion importante de relier les processus de planification nationaux et les connaissances et expériences locales. Néanmoins, des directives, des mesures et des mécanismes particuliers sont nécessaires si l'on veut rattacher les expériences locales aux processus d'établissement des priorités à l'échelon national;

f) Il est essentiel de prendre des mesures claires et détaillées concernant l'efficacité afin de démontrer les incidences sur la réduction de la vulnérabilité des différents groupes, secteurs et sites. Ces mesures sont souvent entravées par un manque de clarté sur la manière dont les objectifs et activités au titre des projets sont rattachés à la réduction de la vulnérabilité face à des risques climatiques particuliers, aux tendances et à la variabilité pour la gestion des écosystèmes;

g) Il faut avoir une meilleure connaissance du temps nécessaire à l'obtention des résultats positifs en fonction des objectifs des différentes démarches en matière d'adaptation;

h) Les informations utilisées dans l'évaluation des possibilités de reproduire des stratégies d'adaptation, notamment sur les ressources nécessaires, et de plus amples renseignements sur l'ampleur de l'intervention et la manière dont celle-ci joue sur l'ampleur des incidences est essentielle pour une bonne planification et de bonnes pratiques en matière d'adaptation.

49. Outre les lacunes recensées concernant la communication et la diffusion d'informations et de connaissances sur les bonnes pratiques et les enseignements à retenir, les mesures suivantes sont recommandées en raison des lacunes et des problèmes recensés afin d'amplifier les mesures d'adaptation relatives à ces questions :

a) L'exécution d'activités de renforcement des capacités et la mise en place de structures ou mécanismes appropriés au niveau national jouent un rôle essentiel afin de relier la planification de l'adaptation au niveau national et au niveau local. Le processus de formulation et d'exécution des PNA pourrait être un bon point de départ pour renforcer la capacité des institutions publiques et faciliter la coordination de la planification de l'adaptation et des pratiques y relatives à différents niveaux;

b) Le renforcement des capacités techniques d'analyser les risques et la planification en vue d'une adaptation efficace sont des solutions technologiques très importantes et efficaces;

c) Outre la mise à disposition de ressources financières et d'instruments financiers adéquats, il est essentiel de mettre en place une structure de financement souple et décentralisée. Celle-ci donnera aux communautés locales et vulnérables la capacité de décider de la meilleure utilisation possible des ressources financières allouées par les autorités supérieures afin de développer la planification de l'adaptation et les pratiques y relatives;

d) La volonté politique, la structure institutionnelle locale (ou appropriation locale) et l'engagement financier des pays partageant des ressources en eau transfrontalières peuvent jouer un rôle crucial dans une bonne coordination visant à réduire la vulnérabilité de ces ressources. L'investissement en temps, qui est souvent essentiel dans l'instauration de partenariats de collaboration pour la gestion des ressources en eau, sera aussi décisif à cet égard;

e) Un mécanisme efficace de suivi et d'évaluation fait aussi partie intégrante des processus de planification de l'adaptation. La création d'un tel mécanisme pourrait porter notamment sur l'élaboration d'une approche graduelle de l'évaluation des risques ainsi que sur la compréhension de la manière de mesurer, d'imputer, de prévoir (les incidences pouvant être très longues à déceler) le coût, ainsi que d'identifier les incidences et de constituer une base de données factuelles. Ce processus serait facilité si l'on veillait à ce que des ressources adéquates soient allouées au suivi et à l'évaluation, si l'on élaborait des indicateurs qui portent sur le contexte et les incidences et produisent des informations permettant de combler les lacunes recensées dans la base de données factuelles, et si l'on intégrait, dès le départ, le suivi et l'évaluation.

II. Synthesis report

[*Anglais seulement*]

A. Mandate

50. SBSTA 40 requested the secretariat, under the guidance of the Chair of the SBSTA, in collaboration with the Adaptation Committee and the Least Developed Countries Expert Group, and with contributions from relevant partner organizations of the NWP, including regional centres and networks, to develop case studies, as appropriate, that highlight the following, for consideration at SBSTA 43:¹⁰

(a) Available and implemented tools and methods for adaptation planning processes addressing the four issues of ecosystems, human settlements, water resources and health;

(b) Good practices and lessons learned in relation to adaptation planning processes, including on M&E, addressing the four issues mentioned above;

(c) Good practices and lessons learned, related to processes and structures for linking national and local adaptation planning.

B. Background

51. COP 19 decided to continue the NWP within the framework of the provisions of decision 2/CP.11, addressing the knowledge needs arising from the Cancun Adaptation Framework and other relevant workstreams and bodies under the Convention and the knowledge needs identified by Parties.¹¹ COP 19 also requested the SBSTA to consider, under the NWP, the four thematic areas of ecosystems, human settlements, water resources and health.¹²

52. In accordance with decision 17/CP.19, SBSTA 40 agreed on a set of activities under the NWP, by 2015, so that information and knowledge may be collected, analysed and disseminated in order to inform adaptation planning and actions at the regional, national and local levels in relation to, inter alia, ecosystems, human settlements, water resources and health.¹³

C. Scope of the note

53. This document provides a synthesis of 170 case studies¹⁴ contributed by Parties and NWP partner organizations, including regional centres and networks. Thematic experts from NWP partner organizations helped in the review of this document to ensure that it is factually faithful to the original case studies.¹⁵

54. Chapter II.D below provides an overview of the case studies, including their distribution by thematic area and region. Chapter II.E–H provides a synthesis of the information contained in the case studies, with each chapter addressing one thematic area (ecosystems, human settlements, water resources and health, respectively). Each of these subchapters presents an

¹¹ Decision 17/CP.19, paragraph 1.

¹² Decision 17/CP.19, paragraph 5.

¹³ FCCC/SBSTA/2014/2, paragraph 19.

¹⁴ Submitted to the secretariat as at 18 June 2015.

¹⁵ Experts from the Alliance for Global Water Adaptation, the Global Water Partnership, the International Union for Conservation of Nature, the Stockholm International Water Institute, the United Nations Human Settlements Programme, the United Nations Environment Programme, the World Conservation Monitoring Centre and the World Health Organization reviewed a draft version of this document.

overview of the thematic area, the tools and methods used, and the good practices and lessons learned.^{16, 17} Chapter II.I analyses the case studies that focus on processes and structures for linking national and local adaptation planning. Chapter II.J concludes the synthesis report with possible next steps. It also provides information that would be useful for adaptation practitioners and policymakers in the light of the gaps and challenges identified.

55. Annex I contains a full list of the case studies. Annex II contains the tools and methods for adaptation planning processes provided in the case studies. Both annexes are organized by thematic area.

D. Overview of the case studies

56. A total of 170 case studies were contributed by Parties and NWP partner organizations in line with the mandate outlined in paragraph 50 above and in response to the invitation issued by the secretariat. The case studies comprise 47 submitted by 21 Parties and 123 submitted by 43 NWP partner organizations. Of the 170 case studies, 153 focus on the thematic areas referred to in paragraph 51 above and 17 focus on processes and structures for linking national and local adaptation planning.

57. While most of the 153 thematic case studies address more than one theme, one primary thematic area was identified for each case study for the purpose of the analysis. Recognizing that most case studies addressed more than one theme, these secondary themes are illustrated in figure 1 above, which shows the distribution of the primary and secondary themes of these case studies.

58. The 17 case studies focusing on processes and structures for linking national and local adaptation planning also addressed water resources (12), human settlements (11), ecosystems (10) and health (9). Of the total 170 case studies, 127 provided information on ongoing adaptation planning and 43 provided information on completed actions.

59. Consideration of indigenous and traditional knowledge was identified in 33 case studies. Gender-sensitive approaches and/or different roles for men and women were discussed in 36 case studies. Information on M&E was included in 116 case studies.

60. The majority of the case studies were from Asia and Africa. Figure 2 above shows the regional distribution of the case studies.

61. Each case study was assigned a code (see annex I for the code, title and other information on each case study, and annex II for the tools and methods used in each case study; both annexes are organized by thematic area). Throughout this document, where appropriate, case studies are referred to by these codes (which are provided mostly in footnotes).

¹⁶ In the synthesis, good practices include but are not limited to processes and structures that: (1) are particularly conducive to stakeholder engagement; (2) consider traditional, indigenous and local knowledge; (3) include monitoring and evaluation to inform iterative adaptation planning; and (4) are concrete examples from the case studies submitted. Lessons learned highlight and summarize factors that influence success as well as challenges, without explicit reference to any examples; rather, they are based on overall assessment of the case studies under each thematic area.

¹⁷ Please note that although not all case studies listed in annex I are referred to in this document, relevant information from all these case studies has been taken into account to compile good practices and lessons learned. Where practical, examples from a selection of case studies are used to illustrate good practices.

E. Case studies addressing ecosystems

1. Overview

62. The case studies addressing ecosystems highlighted the fact that climate change affects ecosystems, their functions and the many benefits and services that they provide to society. The case studies recognized that ecosystems are complex and are interconnected; that they evolve and change over time; and that one of the major drivers of long-term ecosystem change is climate change. Therefore, the case studies indicated that adaptation processes addressing ecosystems need to occur at appropriate spatial and temporal scales.

63. The case studies presented adaptation activities that address a range of climate-related hazards, including:

(a) Drought (36), related to increased summer aridity leading to decreased water availability, decreased rangeland productivity and an increased risk of fires in forests, drylands, croplands and grasslands;

(b) Flood (27), which in turn results in an increase in landslides, and glacial retreat in mountain ecosystems and inland waters;

(c) Shift of seasons (24), related to change in marine systems as a result of large-scale climate shifts.

2. Tools and methods

64. A wide range of tools and methods has been reported in the case studies (see annex II for details). They are mainly available and have been implemented for:

(a) Assessing current and future vulnerability;

(b) Planning, identifying and appraising options for adaptation;

(c) M&E.

65. Ecosystem-based approaches (EBAs) for adaptation to climate change are commonly described in the case studies. EBAs use biodiversity and ecosystem services in an overall adaptation strategy. They include the sustainable management, conservation and restoration of ecosystems so as to provide services that help people to adapt to the adverse effects of climate change. EBAs can be cost-effective and generate social, economic and cultural co-benefits; and contribute to the conservation of biodiversity. They include the sustainable management, conservation and restoration of ecosystems to provide services that help people to adapt to the adverse effects of climate change.¹⁸

66. The case studies reported on hybrid approaches to societal adaptation (combinations of EBAs and hard (engineered, infrastructural) approaches), and approaches to support the adaptation of ecosystems, with their main focus being helping species and habitats to adapt to climate change. It was underlined that a conceptual separation between ecosystem-based adaptation and adaptation of ecosystem approaches is needed, while recognizing the broader role that ecosystems could play in actions to combat climate change.

67. Assessment of the financial viability of EBAs is often an important part of the appraisal of adaptation options. To help select and promote suitable ecosystem-based adaptation strategies and options, tools and methods were provided for microfinance institutions to develop and

¹⁸ Convention on Biological Diversity. 2009. *Connecting Biodiversity and Climate Change Mitigation and Adaptation. Report of the Second Ad Hoc Technical Expert Group on Biodiversity and Climate Change*. Montreal: Convention on Biological Diversity. Available at <<https://www.cbd.int/doc/publications/cbd-ts-41-en.pdf>>.

implement financial products and services.¹⁹ Providing these institutions with such tools and methods facilitates the inclusion of climate risks in the financial products and services, thereby generating ‘climate smart’ lending methodology.

68. The case studies provided examples of tools, frameworks and M&E indicators for adaptation actions addressing ecosystems. M&E indicators highlighted by the case studies include the following:²⁰

(a) Improvement in the health of the ecosystem and its biophysical conditions (e.g. health and population of endangered species);

(b) Evidence of reduction in social vulnerability and improvement in adaptive capacity (e.g. increase in social assets, strengthened local institutions);

(c) Evidence of stakeholders’ knowledge and understanding (including members of local communities) of how to: implement EBAs, hybrid approaches and adaptation of ecosystem approaches; commission vulnerability assessments that integrate ecosystem considerations; and process information being produced by ecosystem and adaptation projects;

(d) Ability to make flexible, forward-looking decisions and evidence of knowledge of how to integrate a consideration of ecosystems and adaptation into national plans, programmes, strategies and policies.

3. Good practices

69. The case studies identified good practices for implementing ecosystem and adaptation projects. A selection is highlighted below.

70. Participatory decision-making that is decentralized to the lowest accountable level, and is iterative, inclusive and adaptive is critical:

(a) Interactive and shared learning and participatory decision-making help build local ownership. Promoting open dialogue, building local institutional capacity, and promoting participation in assessment, appraisal and implementation of adaptation measures are essential ingredients for empowering local communities in their role as local stewards for enhancing the resilience of ecosystems, which is fundamental to the sustainability of the intervention. In all such examples, the common denominator was to build trust and credibility through coordinated and participative actions with key stakeholders;²¹

(b) Developing a participatory benefit-sharing model for natural regeneration of forests and forest management projects, for example, can help establish a strong sense of shared ownership among direct beneficiaries;²²

(c) Building and instilling local institutional capacity could involve strengthening existing social, technical and political actors, institutions and decision-making bodies through targeted training and peer-to-peer learning;²³

(d) The inclusion of women and of poor, vulnerable and marginalized communities in adaptation planning has proven effective given their direct dependence on ecosystems for their livelihoods;²⁴

(e) Flexibility in the design and implementation of adaptation options has led to the increased ability of people to respond to climate change and future uncertainty.²⁵

²³ EcuadorE02, ICIMODE39.

²⁴ CAREE26.

71. Information and knowledge from all sources, including co-construction of knowledge from traditional, local and contemporary scientific sources, should be used to ensure that cultural and gender sensitivities are addressed and robust information is gathered and validated:

(a) The coupling of local knowledge (e.g. institutional knowledge of practitioners or indigenous knowledge on climate change impacts, seasonal shifts in vegetation and ecosystem services; knowledge of foresters on agroforestry practices) with scientific knowledge helps to ensure the robustness of local knowledge and verify scientific knowledge, which may have been formulated at a different scale or using information from elsewhere, while at the same time facilitating understanding of the scientific information. Such coupling or co-construction of knowledge could be facilitated through iterative learning processes, focused workshops and meetings between scientists and local knowledge holders and decision makers;²⁶

(b) Supporting the application of local knowledge can be helpful in identifying economically and socially viable solutions (e.g. locally appropriate solutions) to build the resilience of natural and societal systems.

72. Involvement of both government and non-government stakeholders is key to ensuring effective adaptation planning processes. Building partnerships with both government and non-government stakeholders is integral in supporting more resilient development and avoiding conflicts and inequalities.

73. Integration and inclusion of adaptation initiatives in existing development plans and sectoral strategies can help secure financing, achieve alignment between plans and strategies that may otherwise negatively impact on adaptation initiatives, and facilitate effective coordination among key stakeholders and implementation of adaptation actions.

A case study from Canada²⁷ provides an example of how the inclusion of adaptation initiatives in local development plans and programmes helps to secure financial resources and integrate climate-related risks in existing forest management programmes. In an International Union for Conservation of Nature (IUCN) case study,²⁸ in addition to financial provision, such inclusion helped subdistrict administrative organizations to coordinate effectively with other administrative organizations and government agencies in support of the adaptation initiatives.

74. Economic and livelihood diversification serves to enhance the resilience of people. Such diversification might also help address the resilience of ecosystems through reducing drivers of degradation:

(a) Diversifying economic activities and livelihoods to include resilient options can help not only in addressing natural resource degradation but also in supporting longer term livelihood security and helping to build important natural capital and social infrastructure. In an IUCN example,²⁹ the communities of Mai Root and Laem Klat in Thailand are diversifying their livelihoods beyond fisheries to improve their resilience and that of the ecosystem they depend on to sea level rise and extreme storm events. The provision of ecotourism jobs, created through the establishment of national parks, has provided an alternative livelihood in an example provided by the World Wide Fund for Nature (WWF);³⁰

(b) The Community Environment Conservation Fund used by IUCN³¹ combines natural resource management and livelihood aspects; empowers local communities to directly participate in natural resources management; promotes accountability and governance of natural resources; and provides access to credit in order to diversify livelihood options while reducing

²⁷ CanadaE13.

²⁸ IUCNE05.

²⁹ IUCNE05.

³⁰ WWFE08.

³¹ IUCNE14.

pressure on natural resources within the catchment area. Blue Ventures³² focused on improving biodiversity and marine health in Madagascar in order to increase the sustainable yield for local communities, where coastal resources, critical to the livelihoods of the Vezo people and deeply tied to their culture, are threatened because of the growing human population and continued exploitation of marine resources, exacerbated by coastal erosion and coral reef damage;

(c) In an example from Kenya,³³ a project is seeking to develop a viable financial mechanism for the payment of watershed services that delivers sustainable natural resource management, reduced vulnerability and improved livelihoods. The model will serve as a pilot and learning model for expansion and replication.

75. Provision of financial resources does not guarantee the successful implementation of adaptation actions unless it is coupled with effective institutional set-up, sustainable financial schemes and non-financial services such as education programmes:

(a) The provision of financial services for communities in remote and high risk areas can only be successful when combined with specific risk reduction and adaptation strategies and locally relevant financial schemes, such as microgrants, insurance schemes and mutual benefit schemes;³⁴

(b) The bundling of non-financial services plays a critical role in the success of any financial scheme. In examples provided by International Labour Organization³⁵ and Nestlé,³⁶ financial literacy sessions (focusing on budgeting, farm planning, managing credit and saving) helped farmers to understand the benefits and risks of financial products and their specific terms (e.g. interest rates, premiums), as well as their rights and responsibilities in the use of the loans.

76. M&E is important for measuring the effectiveness and efficiency of adaptation actions:

(a) Participatory M&E systems used in some of the case studies help to establish long-term monitoring and enable stakeholders involved in the adaptation action to undertake adaptive management;

(b) Monitoring livelihood benefits in integrated approaches beyond those fundamental for tracking impact on vulnerability reduction can help to provide information that can support the scaling up of such approaches and nature-based solutions that also yield tangible benefits for climate change mitigation and adaptation (e.g. benefit of mangrove restoration on aquatic animal harvest in the context of climate-related hazards (cyclones, typhoons, storm surges) as well as salinization of soils and freshwater supplies);³⁷

(c) Adaptive management is an important tool for ensuring the continued success of programmes and activities.

4. Lessons learned and factors that influence success

77. The participation of stakeholders resonates through almost all of the case studies as one of the criteria for success. Working with all stakeholders, especially local communities, to analyse climate change vulnerabilities as well as to conceptualize and appraise adaptation measures, helps to build trust, shared ownership and support for the adaptation planning process.

78. Co-construction of indigenous and scientific knowledge and co-design of adaptation measures helps to empower local communities, promote shared understanding of the issues and strengthen the capacity of communities to manage ecosystems. It is imperative to complement

³² BlueVenturesE42.

³³ KenyaE40.

³⁴ ILOE06, UNDP E29.

³⁵ ILOE06.

³⁶ NestléE12.

³⁷ IUCNE15.

such coupling exercises with inclusive processes, iterative learning processes and strengthening of the local institutions.

79. Given the interconnectedness and interdependence of different ecosystems and the relationship between human activities and ecosystems, ecosystem management is influenced by the actions of multiple sectors. High-level coordination across multiple sectors that have convening power and leadership, as well as responsibility over natural resources, facilitates the scaling up of good practices from the local to the national context and the identification of potential benefits and trade-offs between development, environment and adaptation priorities – and therefore the integration of EBA and climate resilience into existing development strategies and plans. This is particularly helpful in leveraging financing for adaptation actions when climate investments are scarce and fragmented.

80. One of the key parameters in the successful implementation of EBA is to work at the most appropriate scale, recognizing the functional scale of the ecosystem concerned. Transboundary cooperation may be necessary in order to access information and data (e.g. climate data) and coordinate activities if the focal ecosystem spans administrative boundaries. Intergovernmental agencies, regional centres and networks could play a critical role in facilitating such cooperation and coordination.³⁸

81. Adaptation planning and actions that are flexible and responsive to capacity and political structure at all levels have led to an increased acceptance of adaptation actions and has increased the ability of people to respond to changing needs. This is best ascertained when adaptation plans and priorities use the evidence base of knowledge for current variability and future impacts, institutional arrangements, the sociopolitical context and capacity at different levels, and when there are mechanisms in place for regular review in the light of new knowledge, unexpected events and changes in capacity.

82. The case studies have demonstrated that one of the successful ways to secure community ownership of adaptation planning and stewardship of ecosystems is through economic diversification, which offers a means for livelihood security in addition to the restoration of ecosystem services.

83. Non-climate drivers of change are numerous and significant, particularly in the short and medium term. An adaptation project cannot be implemented in isolation of these drivers, given that they often underlie ecological and socioeconomic vulnerability. An effective way to take these drivers into account is to ‘unpack’ adaptive capacity and ensure that the overall adaptation strategy not only includes concrete measures such as green infrastructure, but also focuses on building the necessary adaptive capacity of all involved stakeholders, thereby increasing socio-ecological resilience.³⁹

5. Challenges and possible ways to address them

84. Maintaining the high level of time commitment from all actors throughout the stages of adaptation planning and balancing diverse expectations is often challenging. As demonstrated by some case studies, this could be addressed through thorough (i.e. being cognizant of expectations and limitations and assessing risks and opportunities), flexible (i.e. considering trade-offs and building consensus on common pathways) and inclusive engagement approaches.⁴⁰ Obtaining data and analysing downscaled climate data can be challenging in some countries (e.g. because of a lack of data or a lack of finance or technology and technical capacity to access and analyse data) and can often be a limiting factor in understanding vulnerability and future risk of various ecosystems. This could be addressed, to some extent, by undertaking

³⁸ BirdLifeE10, PyreneesE41.

³⁹ WWFE51, UNDPE29.

⁴⁰ SEIE16.

vulnerability assessment in a phased manner, and using existing institutional, local and indigenous knowledge, information and tools to inform initial adaptation planning.

85. M&E is important to measure the effectiveness and efficiency of adaptation approaches and make adjustments as necessary. However, challenges in monitoring and evaluating adaptation planning processes addressing ecosystems exist regarding attribution, time frame, cost, calibration, impacts and evidence base. The success of EBAs often requires a long time frame and a robust learning framework in order to demonstrate the real benefits associated with these approaches. Because of the high cost associated with M&E, there is often an absence of a long-term monitoring programme, impeding the effective measurement of adaptive capacity and ecosystem resilience. The development of a specific M&E methodology could be integrated with financial product development by microfinance institutions to help address this challenge, as is currently planned by the Frankfurt School-United Nations Environment Programme.⁴¹

F. Case studies addressing human settlements

1. Overview

86. The case studies addressing human settlements highlighted that climate change, in addition to other stressors (e.g. exploitation of natural resources), affects rural, urban and coastal settlements, and in turn disrupts their ecological, social and economic functions.

87. Climate-related hazards affecting human settlements reported in the case studies include:

(a) The increase in impervious surfaces in human settlements together with changing precipitation patterns lead to flooding or increased flood risk. River run-off changes and, as a result of the urbanization of river banks, changing river run-off leads to flooding and increased flood risks. Flooding was reported as a key climate hazard in 29 case studies;

(b) Sea level rise increases the likelihood of high floods and seawater intrusion posing a risk to coastal settlements, from small settlements in small island developing States to megacities such as New York. Increasing pressure from development and exploitation of natural resources and loss of protective ecosystems further intensifies the vulnerability of coastal settlements. Sea level rise and storm surges were reported as key climate hazards in 21 case studies;

(c) The densification of the population and the lack of green space in urban environments compounded with more severe and frequent extreme heat increases the urban heat island effect in cities, leading to poor air quality and exposing a higher percentage of people to health risks.

2. Tools and methods

88. Available and implemented tools and methods reported in the case studies are related to:

- (a) Assessing current and future vulnerability;
- (b) Planning, identifying and appraising options for adaptation.

89. Several case studies reported city-wide vulnerability and risk assessment tools for urban settlements.⁴² There were also examples of assessment tools for evaluating climate risks for individual sectors (e.g. business sector, engineering sector).⁴³

⁴¹ FS-UNEPE34.

⁴² KoreaHS07, UCCRNHS11, UCCRNHS20, EEAHS08.

⁴³ KoreaHS09, StudioHS21, StudioHS22.

90. Examples of tools and methods for planning, identifying and appraising options for adaptation included several planning tools addressing urban settlements;⁴⁴ a risk assessment procedure for appraising adaptation options through assessing the climate risk and engineering vulnerability of civil infrastructure to climate change;⁴⁵ a tool to mainstream gender consideration into city-level climate change plans and strategies;⁴⁶ and an ex ante evaluation framework to support the identification of preferred adaptation strategies.⁴⁷

3. Good practices

91. The case studies identified good practices for processes and structures conducive to stakeholder engagement, as well as for facilitating the various steps in the adaptation planning process, which is summarized below.

92. **Collaboration with both private and public sectors at the local level, for example through public–private partnerships, is crucial to ensure that the adaptation planning process leads to transformative social learning, acceptance of adaptation solutions and resilient cities and municipalities:**

(a) The case studies reported positive outcomes in strengthening urban climate resilience through inclusive process-led social learning and innovation. In Stuttgart, for example, a scheme was initiated whereby residents could adopt a tree, resulting in 182 residents now looking after 500 trees;⁴⁸

(b) Public–private partnerships often help harness the potential of local communities, which have a first-hand understanding of local climate conditions. One such partnership led to local development plans and priorities for climate actions, along with the identification of key resources for priority climate actions in Maputo, Mozambique;⁴⁹

(c) Partnership with national institutions such as national meteorological services is helpful in institutionalizing national capacity for scaling up adaptation solutions.⁵⁰

93. **Co-construction of existing local, traditional, ecological and scientific knowledge through inclusive, participatory processes helps create robust and mutually acceptable solutions** by avoiding perceived conflicts of interest and problems resulting from differing views.⁵¹

94. While acknowledging the role of inclusive, participatory processes in effective adaptation planning addressing human settlements, it is **also imperative to have an effective leader in creating and building momentum** through providing capital funds; creating economic incentives for greening strategies; communicating results of the good practices to create goodwill in the community; and institutionalizing good practices. City mayors have often played such a leadership role, as reported in some case studies.⁵²

95. **Measuring, documenting and communicating good practices** provide an effective means by which to enhance awareness and replicate such practices at all levels. The Amsterdam rainproof project⁵³ made use of an online platform to facilitate the documentation and dissemination of relevant project information and experiences.

⁴⁴ EIHS25, NetherlandsHS28, SEIHS19.

⁴⁶ UNHabitatHS15.

⁴⁷ NetherlandsHS28.

⁴⁸ EEAHS08.

⁴⁹ SEIHS19.

⁵⁰ WFEOHS30.

⁵¹ EEAHS08.

⁵² EEAHS08.

⁵³ NetherlandsHS06.

96. Economic and livelihood diversification could serve as an effective approach in creating settlements that are resilient to climate change:

(a) Developing and implementing local strategies that create job opportunities, in particular green jobs, helps to engage public and private sectors. Tools for livelihood diversification can help bring transformative changes to development.⁵⁴ The Kenya Slum Upgrading and Prevention Programme⁵⁵ aims to improve the livelihoods of people living and working in slums through targeted interventions to address climate change and infrastructure services (such as regularization of land tenure in slums and informal settlements, resource mobilization for slum upgrading, and prevention initiatives);

(b) Climate resilience of human settlements could be enhanced through the creation of green jobs. The opportunity for urban planners to create garden centres as part of the Amsterdam rainproof project⁵⁶ provides a good example of ‘climate proofing’ a city, which has economic incentives for communities.

97. Investment in engineering prototypes can act as a springboard for ‘climate proofing’ settlements. The availability of financial resources to invest in greening physical infrastructure is often key to creating resilient cities, for example, providing financial support for consideration and construction of green adaptation strategies in urban development plans and priorities. The City of Stuttgart⁵⁷ has provided financial support to green about 60,000 square metres of roofs since 1986.

98. Simple and low-cost pilot interventions could provide effective local solutions for creating climate-resilient settlements, especially in rural and low-income settlements. For example, school buildings built with locally available materials in Mozambique have a dual purpose – they also offer shelter to communities in case of floods or cyclones.⁵⁸

99. To be adaptive and resilient to climate change, interventions must be decided through an informed and iterative planning process with the participation of all stakeholders. The National Delta Programme in the Netherlands has an in-built cyclic adaptive planning (with a step-by-step approach) and decision-making pathways to address future climatological and socioeconomic uncertainties.⁵⁹

100. M&E of adaptation responses is important for avoiding potentially maladaptive developments. Successful implementation must be supported by appropriate arrangements and M&E indicators so that necessary adjustments can be made. The adaptive capacity of infrastructure – ascertained by monitoring design, operation and maintenance – could serve as a good indicator to measure the resilience of human settlements to future climate changes, including extreme events.⁶⁰

4. Lessons learned and factors that influence success

101. Local institutions are often at the forefront of developing strategies and implementing programmes to improve disaster preparedness and crisis response in cities. Therefore it is important to build local institutional capacity in both public and private sectors. **Public–private partnerships often play an essential role** in building resilient cities.

102. **Integrating or aligning climate change adaptation considerations into sectoral and settlement-wide development planning processes** of local bodies and governments helps to

⁵⁴ ILOHS01.

⁵⁵ KenyaHS14.

⁵⁶ NetherlandsHS06.

⁵⁷ EEHS08.

⁵⁸ UNHabitatHS13.

⁵⁹ NetherlandsHS28.

⁶⁰ WFEHS30, WFEHS31.

strengthen the linkage between local and national adaptation planning, ensuring greater recognition and facilitating the implementation of adaptation measures.

103. **An integrated approach** with a mix of soft and hard measures often proves cost-effective and can help optimize resources, particularly when they are limited.

104. **Access to robust, context-specific climate and other scientific data and information is important.** Such access could be improved by securing a partnership with or dedicated support from national institutions such as national meteorological services.⁶¹

105. **The co-production of knowledge** is effective only when supplemented with effective training, ongoing learning and the communication of results and outcomes to the knowledge holders.

106. Having a **leader to drive adaptation actions forward**, such as the mayor or governor or an expert, helps create trust and build the credibility and social acceptability of such actions.

107. Some considerations in achieving overall resilience of human settlements include:

(a) Ways to enhance adaptive capacity and reduce vulnerability of the most exposed population in the settlement;

(b) Innovative low-cost prototypes of adaptive measures leveraging local knowledge and resources;

(c) Economic incentives for local communities as part of the adaptation solutions.

5. Challenges and possible ways to address them

108. One challenge that is faced is **a gap between research output and the operational needs of users**; for example, a lack of research output or a lack of access to climate data or information can limit users such as urban planners in developing ‘climate-proof’ plans and integrating climate considerations in adaptation planning processes.⁶² The Vulnerability Assessment Tool to Build Climate Change Adaptation Plan, developed by the Ministry of Environment of the Republic of Korea, provides information on the impacts of climate change for different sectors, and is intended to be used by local governments in establishing climate adaptation plans.⁶³

109. **The poorest populations in rural or urban settlements are often the most exposed or vulnerable to climate hazards** owing to, for example, the proximity of low-income settlements to areas prone to flood such as floodplains or the location of slums in densely populated inner city areas with poor air quality. An effective adaptation response should address the adaptive capacity of these populations and reduce their socioeconomic vulnerability in order to be effective in the overall context of enhancing resilience in and of human settlements.⁶⁴ There is also a need for the inclusion of expropriation of land and compensation schemes for the affected communities (e.g. those affected by periodic flooding) in the overall adaptation package, which could be financially challenging.⁶⁵

110. Although participatory decision-making that is decentralized to the lowest accountable level is effective in adaptation planning processes, devolution of powers to local actors or local institutions is not always fully matched by adequate transfer of technical knowledge or access to financial resources.

111. **Lack of adequate financial resources** can be a limiting factor in implementing hard adaptation solutions or scaling up successful prototypes. In the case of widening the River Waal

⁶¹ WFEOHS30.

⁶² EEAHS08, KoreaHS07, NorwayHS02.

⁶³ KoreaHS07.

⁶⁴ UCCRNHS11.

⁶⁵ EEAHS23.

in the Netherlands to allow more room for periodic high river discharge, the financial challenge was partially addressed through securing additional funding from the affected provinces, water boards and municipalities.⁶⁶

112. **Creating a network of stakeholders that can sustain adaptation action takes time.**⁶⁷ The speed at which measures are implemented depends on operational procedures, protocols, institutions and people. For example, setting up the network in the Amsterdam rainproof project took longer than the two years originally envisaged because of the complexity of connecting experts from different sectors, disciplines and locations within the Netherlands.

G. Case studies addressing water resources

1. Overview

113. Recognizing the intrinsic linkage between inland and non-inland water resources and other sectors and ecosystems, the sensitivity of the water cycle to climate-related changes and the great challenges in using climate models to project such changes, and the longevity (decades to centuries) of water management interventions, the case studies addressing water resources highlighted that climate change increases the vulnerability of water resources. Both availability and accessibility (quantity) and degradation (quality) of water resources are affected by climate change, leading to adverse impacts on ecosystems and biodiversity; agriculture and food security; land use and forestry; water supply and sanitation; health; and urban settlements and infrastructure. Impacts on regional water availability and accessibility could lead to regional water crises, resulting in economic destabilization and conflict, which would affect poor and vulnerable people the most.

114. Climate-related hazards affecting water resources that were reported in the case studies include:

(a) Changes in run-off in major river basins, with inter-seasonal disparities leading to increased run-off during rainy seasons and water shortages in dry seasons, affect livelihoods across the river basins. Glacial lake outburst floods released from temporary glacial lakes can cause mudflows and floods and, in mountainous regions, avalanches, landslides and rockfalls or, in the other extreme, reduced water availability. Increase in run-off and flooding causes degradation of water quality, mostly due to the increase in the load of nutrients and pesticides. Many case studies addressed drought (36) and flood (36) as key climate hazards;

(b) Sea level rise, altered frequency and intensity of precipitation, increased water temperature and more intense storm events affect estuaries and coasts. In turn, this affects the health of coastlines, including the people and species that inhabit them.

2. Tools and methods

115. Available and implemented tools and methods reported in the case studies are related to:

- (a) Assessing current and future vulnerability;
- (b) Planning, identifying and appraising options for adaptation;
- (c) M&E.

116. A range of methods and tools for assessing current and future vulnerability was reported in the case studies. These include top-down approaches based on hydrological and socioeconomic analyses at the basin-scale and bottom-up approaches to vulnerability

⁶⁶ EEAHS23, EEAHS29.

⁶⁷ NetherlandsHS28, NetherlandsHS06, SEIHS19, WFEHS30, WFEHS31.

assessment, including consideration of system limits that serve as a means of framing uncertainties about future climate projections and that are informed by local and indigenous knowledge.

117. In regard to planning, identifying and appraising options for adaptation, guidance and risk-informed decision frameworks were reported for determining the threshold of infrastructure, energy, agriculture, water supply and ecosystem sectors, as they are relevant in relation to climate risk to water resources (e.g. flooding). Inclusive and iterative processes for planning and appraising adaptation options, including the assessment of priorities and trade-offs, is key to designing successful context-specific adaptation interventions and avoiding potential maladaptation.

118. Examples of M&E frameworks included iterative processes for assessing and amending plans and actions thereby facilitating adaptive management approaches, participatory monitoring processes and the promotion of measureable evidence-based indicator systems.

3. Good practices

119. The case studies identified good practices for adaptation processes and structures conducive to stakeholder engagement, and for facilitating the various steps in the adaptation planning process, which is summarized below.

120. **The effective alignment of national and local institutions, policies and plans facilitate the identification and integration of effective responses to climate-induced hazards.** In Costa Rica, in order to prepare communities for and build their resilience to flooding, the Costa Rica Early Warning System for Hydrometeorological Hazards Project developed an effective structure for implementing an operating early warning system in the Sarapiquí River basin. The project involved strengthening coordination and cooperation between the National Meteorological Institute, the Costa Rican Institute of Electricity, the National Commission for Risk Prevention and Emergency Response and the surrounding communities. It also involved the strengthening of local capacity for the prevention of and response to flood hazards.⁶⁸ In Ghana, aligning the Water, Climate and Development Programme with the national strategic development planning framework facilitated the recognition of water security and climate resilience at the sectoral and subnational planning levels.⁶⁹

121. **Recognizing the transboundary nature of water resources affecting communities from different countries and regions at all levels, an inclusive and structured process to engage stakeholders at the lowest accountable level helps to manage conflict and promote ownership of adaptation interventions:**

(a) **A mix of top-down and bottom-up measures (from the transboundary or international level to the regional, national and local levels) is a viable solution when developing an adaptation strategy addressing transboundary water resources.** When an adaptation strategy was developed for the River Rhine, measures built on planned frameworks at national and international levels (e.g. implementation of the European Union water framework directive and the European Union floods directive as well as the Action Plan on Floods from the International Commission for the Protection for the Rhine (ICPR), in effect since 1998).⁷⁰ The summit of the Danube heads of state was essential for generating commitment to and leadership for the Lower Danube Green Corridor agreement, while regional institutions, particularly the European Union and ICPR, were crucial in promoting reform, benchmarking practice and sharing knowledge of successful practices;⁷¹

⁶⁸ CostaRicaW01.

⁶⁹ GWPW24.

⁷⁰ ICPDRW12.

⁷¹ WWFW47.

(b) **Bilateral frameworks and directives could provide the necessary political will and help in accessing financial resources.** The water treaty between Mexico and the United States of America has provided a stronger mandate for the National Water Commission of Mexico (CONAGUA, Comisión Nacional del Agua) to intervene in the Rio Bravo (Rio Grande) basin shared by these two countries, and the treaty has also enabled access to finance from the North American Development Bank. WWF and the Fundación Gonzalo Río Arronte IAP have formed partnerships as ‘boundary organizations’ and facilitated flows of knowledge through translating scientific information into policy and practice from the local to international scale.⁷²

122. Inclusive and iterative processes for planning and appraising adaptation options, including assessment of priorities and trade-offs, are key to designing successful context-specific adaptation interventions and avoiding potential maladaptation:

(a) As a part of an assessment study conducted in the drought and flood prone areas of the Ganges River basin, adaptation effectiveness indicators were identified using a multi-criteria decision-making methodology whereby communities prioritized effective adaptation options in a participatory manner.⁷³ Another example of an inclusive process is the National Integrated Drought Information System (United States), which involved the coordination of scientists across the physical, natural and social sciences, water resources professionals across scales of decision and action, and preparedness communities across the country in order to produce a prototype mechanism for developing early warning information for proactive drought risk reduction;⁷⁴

(b) Considering priorities and trade-offs when appraising adaptation options helps in selecting optimal interventions. For example, building infrastructure such as sea walls could adversely affect wetlands by preventing sediment transport essential to that ecosystem. Considering this trade-off, the New Jersey Coastal Blue Acres land acquisition programme acquired coastal lands that were damaged or prone to damage by storms in order for these lands to provide a buffer for other lands, as well as providing space for recreation and conservation;⁷⁵

(c) An iterative process of mutual learning, participatory techniques and a bottom-up approach ensure that stakeholders play an active role in determining appropriate strategies for the management of river basins. The BeWater Project used methodologies integrating physical, ecological, social and management processes to develop water management options for four case study river basins across the Mediterranean. These options are discussed with local communities who participate in preparing locally relevant adaptation plans that may be scaled up to develop guidelines of national and international relevance.⁷⁶

123. Public-private partnerships could help ensure success with a decentralized decision-making process. The Manila Water Company in the Philippines, through decentralized decision-making and target-based systems, was successful in promoting personal accountability and institutionalizing values of integrity and customer centricity. These values in turn promoted climate-resilient service improvements and helped to create a strong brand.⁷⁷ Private sector involvement is important in demonstrating profitability of adaptation activities to local communities.⁷⁸

124. Innovative financial systems trigger cost-effective solutions. In order to maintain water availability under growing demand, adaptation options must either free up additional water sources or reallocate water distribution; for example, through the creation of water markets. The Metropolitan Water District of Southern California has created a water market that

⁷² WWFW51.

⁷³ IGESW02.

⁷⁴ USAW20.

⁷⁵ USAW15.

⁷⁶ StudioW09.

⁷⁷ UCCRNW33.

⁷⁸ WWFW49.

compensates landowners and agencies for irrigating less land.⁷⁹ A permanent financial mechanism through local institutionalization – where downstream water users pay into a fund, often through their water bills, that finances incentives for upstream landowners to conserve land – is another useful example of how to secure watershed protection investment in the long term.⁸⁰

125. Inclusive, interdisciplinary, systematic assessments of climate change impacts and analyses of future climate risks to water resources help decision-making on adaptation interventions with socioeconomic and environmental considerations.

(a) The Alliance for Global Water Adaptation (AGWA) methodology is a good example of a systemic bottom-up approach to water resources planning under climate change;⁸¹

(b) Another example of such good practices is the analysis of future risk of flooding for the Magdalena River basin in Colombia, which was performed using multiple plausible future projections of climate, findings from expert workshops and literature searches (inputs to land use and water demand), downscaling and hydrological modelling tools, and water allocation models (to explore future water shortages). Socioeconomic scenarios were developed together with local stakeholders, authorities such as national and regional governments and water management authorities, and sectoral representatives from the ministries of agriculture, environment, planning, energy and mining. The necessary modelling tools were developed and validated. Training was provided, the software was made available and detailed reports were made public.⁸²

126. Decision-making for the planning, design, financing and operation of water infrastructure is often made under conditions of great uncertainty. **Investments in water infrastructure need to consider both current and future risks at all stages of development if the infrastructure is to be robust and resilient to climate change.** AGWA is developing and testing its Decision Support System, which focuses on infrastructure and institutions. Components of the system are being implemented in 20 pilot programmes globally, engaging water resource managers, utilities, governments, the private sector and international non-governmental organizations.⁸³

127. **Co-production of knowledge leads to locally appropriate, cost-effective adaptation solutions.** Demonstration projects have been essential in confirming the benefits and inspiring wider adoption and scaling up. The tank restoration project of the Better Cotton Initiative succeeded because work with the villages was led by their demand, respected their needs, utilized locally available technologies and provided immediate benefits.⁸⁴ The Ouranos water management programme in Canada demonstrated that co-construction with the communities affected by the climate change impacts ensured better results because the options proposed targeted the sources of vulnerability identified by all project partners.⁸⁵ A ‘springshed’ development project was implemented in Nepal for reviving springs, leading to better water supply and healthier ecosystem services. Women and marginalized groups were engaged in the project.⁸⁶

128. **Strengthening local adaptive capacity to sustain livelihoods is a useful entry point to meaningful engagement of communities on water security.** In the AdaptCap pilot project for the installation of a water treatment plant in the village of Desaraju Palli, India, the community was involved in the project’s development and assessment after training in climate change and

⁷⁹ USAW15.

⁸⁰ RareW22.

⁸¹ UNECEW13.

⁸² UNESCO-IHEW04.

⁸³ AGWAW05.

⁸⁴ WWFW51.

⁸⁵ OCW35.

⁸⁶ ICIMODW16.

adaptation. The community contributed to the operation and maintenance of the treatment plant, and the local and state governments came forward to replicate and expand on work done.⁸⁷

129. **Livelihood diversification solutions inspire local commitments and actions to resilience.** Nature Seekers was established with the aim of protecting the nesting ground of sea turtles along Matura Beach in Trinidad and Tobago. This was the first co-management model developed between community members and the Forestry Division of Trinidad and Tobago for sea turtle conservation where the community sustainably benefited from the natural resources. The Nature Seekers model has been applied to adjacent similar watersheds where the community is included in both conservation and business initiatives.⁸⁸

130. The following good practices for M&E have emerged:

(a) **An iterative adaptive process is a key to assessing and amending plans and actions in the light of future climate risks and information.** The climate change adaptation strategy for the Danube basin (Central and Eastern Europe) provides a good example, where the river basin and flood risk management plans are updated based on a six-year planning cycle, allowing for adaptive management of the basin by taking into account new information on climate risks.⁸⁹ In the Netherlands, pilot projects of innovative technological interventions to ensure the availability of freshwater supply at farm level in time and of appropriate quality and quantity were carried out. Monitoring of the hydrogeological performance of the three projects will be extended (to 2015–2017) in order to evaluate how the technologies perform under variable climatic conditions;⁹⁰

(b) **Participatory monitoring of adaptation interventions is a key to maintaining the adaptive capacity of communities.** Participatory M&E of conflict situations exacerbated by climate change in North Darfur provides a good example and has resulted in improved community resilience and adaptive capacity. Peace Committees hold weekly or biweekly meetings to continuously monitor natural resource use and resource-based conflicts in their local areas, and use this information to resolve or avoid further conflict, thereby maintaining the adaptive capacity of the communities;⁹¹

(c) **An evidence-based system with measurable indicators is an effective way to monitor the progress of adaptation interventions and scale up good practices.** Recognizing that reform of agricultural water management is key to achieving sustainable water use and reducing the vulnerability of rural communities, WWF is developing and applying better management practices in cotton production. WWF work in the Godavari River basin in India involves 20,000 cotton farmers in a demonstration project to test the Better Cotton Initiative's global sustainability model. The initial tank restoration project tracked a range of costs and benefits, establishing the case for broader public investment.⁹²

4. Lessons learned and factors that influence success

131. A number of factors that influence success have emerged as crucial for adaptation planning **addressing transboundary water resources:**

(a) A sound legal and institutional framework for transboundary cooperation and a governance system that can learn and anticipate shifting needs and conditions;

(b) A shared scientific knowledge base for joint decision-making;

⁸⁷ AdelphiW40.

⁸⁸ Trinidad&TobagoW43.

⁸⁹ ICPDRW11.

⁹⁰ NetherlandsW14.

⁹¹ PracticalActionW37.

⁹² WWFW49.

(c) A clear political mandate and commitment, enabling administrations, experts and stakeholders to work collaboratively.

132. The following lessons have emerged in relation to **assessment and planning adaptation options**:

(a) Intersectoral coordination is an important criterion for success given the interlinkage of water resources with other sectors;

(b) Creating flexible decision pathways, developing adaptive governance systems, and incorporating bottom-up approaches to vulnerability assessments and both ecological and engineering views on resilience help overcome the uncertainties of climate change and enhance the resilience of long-lasting water infrastructure;

(c) It is important to consider the optimal mix of both bottom-up approaches to vulnerability assessment, which reflect inherent system limits and serve as an effective means of framing uncertainties about future climate projections, and top-down methodologies, which rely heavily on climate models to frame vulnerability;

(d) It is important to consider flexible decision pathways that use economic analytical methodologies to estimate the costs of maintaining multiple options and evaluate trade-offs between waiting for more certain information before implementation versus acting in the short term with less information. Tank restoration work of the Better Cotton Initiative in India shows how building community capacity, applying technologies that are locally available and profitable for communities, and undertaking small-scale measures can add up to effective and inexpensive large-scale and pro-poor climate change adaptation.⁹³ Such an approach contrasts with the negative consequences of large water infrastructure in terms of cost, constraints on scaling up implementation, displacement of people, limited capacity for village self-determination and substantial environmental impact;

(e) A full assessment of possible interventions, including their effects on the economy and on environmental quality, is recommended so that adaptation options are socioeconomically viable. Furthermore, it is useful to integrate both engineering (hard infrastructure) and ecological (dynamic social-ecological systems) perspectives and approaches to resilience. Water management and infrastructure decisions should not externalize the environmental and social impacts during the decision-making process;

(f) It is important to consider innovative local level financing and revenue options to secure long-term and sustainable investments.

133. **Capacity-building** should be an inherent and one of the initial components of the adaptation planning process, in particular to ensure the success of innovative technological interventions at the community level.

134. Key lessons learned in relation to **the importance of local institutional knowledge and co-production of scientific and local knowledge** are:

(a) Creating a learning environment in the form of a 'living lab', where stakeholders and scientists have the opportunity to explore adaptation measures by dialogue, experiment and fieldwork, is beneficial;

(b) Focusing on recent events and stakeholder knowledge, and moving beyond discussions on uncertainty, help shift the discussion of climate change adaptation from research-based towards action-oriented solutions;

(c) Connecting science and practice over the long term involves sustained communication and building trust through partnerships with the people who live in the affected communities and ensures that resources are directed towards existing institutions.

⁹³ WWF48.

135. The following factors have emerged as important for successful **provision and dissemination of knowledge**:

- (a) The production of good science is important but the communication of study results and the tools developed is crucial and needs to be tailored to stakeholders and audiences;
- (b) The development of localized science is crucial in order to draw attention to the local impacts of climate change at the regional level.

136. Specific lessons learned in **M&E**:

- (a) A cyclic adaptive approach is helpful to deal with uncertainty, with updated assessments and targeted amendments to existing measures based on new information;
- (b) Functional observations and monitoring systems are essential, not only to inform scientific assessments but also to provide a consistent and reliable source of information;
- (c) Both climate change risk reduction and economic performance need to be incorporated into M&E frameworks to determine the progress of adaptation interventions and the investment required.

5. Challenges and possible ways to address them

137. The case studies identified challenges in addressing adaptation actions related to transboundary water resources:

- (a) Transboundary water resources management often requires a strategic roadmap with **political will and financial commitment** of the countries sharing the water resources. There is a need for joint scenarios, modelling and vulnerability assessment, but the extent of harmonization could be limited by resources and time;
- (b) Building networks and collaborative partnerships that effectively connect knowledge holders can be challenging because it requires an investment of time;
- (c) There is a need for capacity-building in adaptation among relevant sectors and continuous intersectoral communication and coordination.

138. **A lack of or limited funding often becomes a barrier to harmonizing national and subnational policies and implementing adaptation interventions. Collaborative partnerships can help address such challenges.** Collaborative partnerships of non-governmental organizations, funders, government agencies and researchers have yielded success in the sharing of resources and expertise to help improve watersheds.

H. Case studies addressing health

1. Overview

139. The case studies addressing health highlighted that climate change exacerbates the environmental determinants of health, such as through its risk to water resources, infrastructure and sanitation, hence posing a serious health risk to societies, especially their vulnerable groups (e.g. the elderly, infants and young children, chronically ill people and people who work outdoors).

140. The case studies reported that climate-related hazards affecting health include:

- (a) More frequent and intense extreme weather events such as floods, cyclones and droughts, shifting weather patterns and extreme heat (such as heatwaves) increase the risk of disease and death related to such hazards;

(b) Sea level rise, seawater intrusion and coastal inundation can provide new breeding grounds for mosquitoes, increasing the risk of waterborne diseases such as dengue fever and malaria. Sea level rise was reported as a key climate hazard in seven case studies;

(c) Drought leads to the more common occurrence of nutrition-related diseases. Drought was reported as a key climate hazard in 10 case studies.

2. Tools and methods

141. Examples of tools and guidance for assessing the current and future vulnerability of health to climate change include an assessment tool that uses a combination of qualitative and quantitative methods to assess the impacts of climate change on a range of climate-related health concerns⁹⁴ and an information guide on the health impacts of climate change.⁹⁵

142. Examples of planning, identifying and appraising options for adaptation include a tool for estimating health and adaptation costs for Europe,⁹⁶ guidance to include climate-sensitive health risks into NAPs,⁹⁷ and a methodology aimed at strengthening the adaptive capacity of national health institutions, including field practitioners, to respond to climate-sensitive health risks.⁹⁸

143. Two examples were reported for M&E, with both emphasizing the usefulness of an iterative adaptation planning process. A vulnerability reduction assessment tool was applied in Bangladesh, Ethiopia, Nepal and the United Republic of Tanzania for defining and guiding the implementation of climate-resilient health policies in water, sanitation and hygiene at the national and local levels. The tool guides an iterative risk management process that sets a health vulnerability baseline in relation to climate change and monitors progress of the adaptation action by assessing how the baseline has changed over time.⁹⁹ The Building Resilience Against Climate Effects (BRACE) framework helps the 18 States of the United States using it to develop and implement health adaptation plans and address gaps in critical public health functions and services through an iterative process.¹⁰⁰

3. Good practices

144. Good practices for processes, structures and approaches that are conducive to stakeholder engagement and good practices that facilitate the steps in the adaptation process have been reported in the case studies.

145. Considering the interlinkages and interdependencies of health with other sectors, such as transport, energy, water resources, food security and agriculture, and human settlements, **robust multisectoral mechanisms engaging interdisciplinary stakeholders at the national and subnational levels are conducive to building health systems that are resilient to climate change.** These mechanisms also help in cost sharing of the actions and promoting health co-benefits of actions in other sectors. The smooth functioning of the heatwave early warning system in China, for example, relied on effective coordination between the health, meteorological and educational institutions.¹⁰¹

146. **Inclusive processes that engage local and indigenous people often help secure ownership and develop and strengthen local institutional capacity in delivering results in meaningful and locally appropriate ways:**

¹⁰⁰ USAH02.

¹⁰¹ WHO/UNDPH06.

(a) In Ghana, the United Nations Development Programme (UNDP) engaged local indigenous people in project activities where traditional practices can help educate the members of the district-based-inter-agency committee on climate change and health. Community health volunteers from indigenous and local communities serve the health needs of community members and report on emerging diseases using a community health register;¹⁰²

(b) Inuit and Northern First Nation communities are undertaking projects that meet the needs and priorities of their communities in a meaningful and locally appropriate manner and have a culturally respectful approach. Research moves from a community-based to a community-led framework, resulting in a community's capacity to respond quickly to research questions and needs that emerge and to actively create evidence-based health adaptation strategies to respond to the challenges of a rapidly changing climate.¹⁰³

147. **Innovative and flexible funding structures help decentralize engagement to the lowest accountable level.** Health Canada's Climate Change and Health Adaptation Program (CCHAP) is an innovative funding structure that fosters, supports and mobilizes community-led climate change and health adaptation research in First Nation and Inuit communities across the north of the country. The programme allocates nearly 85 per cent of funding to community-driven research through a competitive process. A selection committee made up of community members approves proposals and decides how best to allocate funds to suit the needs of communities.¹⁰⁴

148. **Co-production of scientific, local and indigenous knowledge is effective in responding to community needs and priorities.** CCHAP supports a community-scientist interface for knowledge exchange and joint validation and multi-stakeholder dialogues in order to gain institutional support, mainstream traditional knowledge and practices in adaptation measures, and develop action plans that are more responsive to community needs and priorities.¹⁰⁵

149. **Developing and disseminating evidence of health benefits (e.g. reduced health impacts, reduced health-care costs) and co-benefits to other sectors (e.g. water security) from adaptation actions could help build local and political ownership of such actions addressing health.** An adaptation project in Barbados treating wastewater to be used for recharging aquifers and for irrigation is expected to demonstrate a reduced incidence of dengue fever while increasing water safety and availability and public acceptance of treated wastewater for non-potable use.¹⁰⁶

150. **Integration of climate-related health risks into existing national and sectoral plans and policies is conducive to developing health systems that are resilient to climate change.** The National Heat-Health Action Plan for the former Yugoslav Republic of Macedonia was developed within the National Strategy for Adaptation for the health sector to implement adaptation measures and prevent health consequences associated with extreme heat due to climate change.¹⁰⁷ Ongoing work of the World Health Organization (WHO) to support its member States¹⁰⁸ in developing the health component of their NAPs is a good example of the consideration of health in an adaptation planning process at the national level.¹⁰⁹ In Samoa,

¹⁰⁹ WHOH03.

public health plans and strategies have been revised to incorporate climate risk projections and adaptive planning.¹¹⁰

151. **Documenting and disseminating information and knowledge on health impacts of climate change, health-related vulnerability and adaptation assessments, and adaptation plans and actions provide an important knowledge base and a helpful basis for scaling up and scaling out good practices.** The resource guide for advanced learning on understanding the climate change and health interface developed by the One UN Climate Change Learning Partnership (UN CC:Learn), with technical inputs from WHO, is a good example. The development of ‘community of practice’ groups for both geographical regions and climate and health topics has allowed exchange of information and best practices among stakeholders.¹¹¹

152. The following good practices for M&E have emerged:

(a) **Setting attributable indicators for a baseline helps to evaluate the progress of an adaptation intervention. One effective indicator is a reduction in health impacts,** as in the case of the vulnerability reduction assessment tool used in Bangladesh, Ethiopia, Nepal and the United Republic of Tanzania for defining and guiding the implementation of climate-resilient health policies in water, sanitation and hygiene at the national level;¹¹²

(b) **Inclusive, participatory processes that engage local and indigenous communities also strengthen the evaluation process.** In Fiji, community visits were often undertaken to disseminate key assessment findings and to develop a community map and a seasonal calendar at each pilot site. Community members were able to identify and prioritize areas of need in relation to climate change; showing increased knowledge on the impact climate change has on health.¹¹³

153. **Frameworks and processes with anticipatory and iterative components allow the evaluation and improvement of activities.** The BRACE framework is a good example in this regard (see para. 143 above).¹¹⁴

4. Lessons learned and factors that influence success

154. The case studies reported a number of key factors that enable effective response actions in addressing the health risks related to climate change.

155. The vulnerability and adaptive capacity of communities will evolve over time as the climate changes and more is understood (i.e. more data become available and are validated) about the relationship between climate and health determinants and outcomes. Thus **the policy and planning process will benefit from iterative learning, assessment and understanding of the needs and capacity of communities to respond to climate-related health risks and the relevance of interventions.**

156. Recognizing the pivotal role of national and local institutions in addressing climate-related health risks, it is imperative to **enhance their understanding of the links between climate change and health and to strengthen their capacity** in technical areas, such as in early detection and adequate response and in anticipating the consequences of emerging diseases related to climate change.

157. **Traditional and scientific knowledge systems must work in tandem,** while respecting diverse values, and build on respective strengths in order for communities and governments to develop adaptation plans that reduce environmental and health risks to ultimately save lives.

¹¹⁰ WHO/UNDPH12.

¹¹¹ USAH02.

¹¹² WHOH01.

¹¹³ WHO/UNDPH12.

¹¹⁴ USAH02.

158. The complex interlinkages between health and other sectors necessitate the **engagement of multisectoral and interdisciplinary stakeholders** at the national, subnational and community level. Such engagement is most successful when initiated at a very early stage of the process.

159. Pilot adaptation interventions in areas of heightened health risk need to be documented and analysed to enable them to be scaled up and scaled out.

160. **Integrating climate-related health risks into national and sectoral strategies and policies** is an effective approach to ensure that these risks are considered when making decisions. However, it is also important to consider funding implications and ensure that sufficient funds are available for implementation of the strategies.

161. Climate hazards disproportionately affect the health of high risk and vulnerable groups (related to socioeconomic factors) in the community. It is important therefore to **consider priority actions for these groups**.

162. Investment into technology-based solutions can exponentially increase the capacity of the health sector to respond to climate variability. An example is the supply of telecommunication equipment (such as mobile phones) in Ghana, which led to increased health-care delivery to communities in climate-sensitive environments within the periphery of the pilot districts, that bear significant burdens of disease related to climate change.¹¹⁵

5. Challenges and possible ways to address them

163. A lack or limited understanding of how climate change impacts health is often a barrier to developing climate-resilient health plans and actions at different levels.

164. While there is increasing recognition of the role of traditional knowledge in adaptation, it is mainly concentrated in the early stages of the adaptation process – primarily in observation and assessment. The uptake of traditional knowledge, capacity enhancement and focused engagement needs a time commitment and resources to develop and scale up. Most funding programmes are one-offs that do not allow communities to build momentum, capacity and critical mass for addressing the inclusion of traditional knowledge. The CCHAP innovative funding model (see paras 147 and 148 above) demonstrates how traditional knowledge can be successfully incorporated into the design, planning and delivery of adaptation plans.¹¹⁶

165. The outcomes and outputs of projects often focus on adaptation in the short term. While this is appropriate and necessary given the data collection and reporting in many countries, it is also important to place the national project activities in the context of an iterative risk management approach to the health risks of climate change. As early warning systems are implemented, it could be helpful to engage in discussions of how often the system should be re-evaluated to determine whether thresholds, timing and responses remain relevant or should be flexible in a changing climate.

166. Technology is critical to building resilience to climate change in the health sector. Funding limitations can, however, mean the most optimal solutions, which are often technological, cannot be implemented.

167. Many countries have health delivery systems but lack the capacity and knowledge needed (including by field practitioners) to respond to climate change. Some initiatives undertaken by WHO and UNDP have been helpful in addressing the challenge by facilitating access to national

¹¹⁵ WHO/UNDPH12.

¹¹⁶ CanadaH13.

or international experts and providing support material for national vulnerability and adaptation assessments and vulnerability reduction assessments.¹¹⁷

168. The case studies highlighted the limited national and international investment in the health sector for responses to climate change, despite the cost savings that adaptation measures would bring. For example, during the development of the National Heat-Health Action Plan in the former Yugoslav Republic of Macedonia, the WHO tool to estimate health and adaptation costs highlighted the importance of adaptation by showing that annual heat-health adaptation measures would be approximately 12 million of the former Yugoslav Republic of Macedonia denars (MKD) compared with the health damage costs without adaptation of MKD 170 million.¹¹⁸

I. Processes and structures for linking national and local adaptation planning

1. Overview

169. The 17 case studies with a key focus on linking national and local adaptation planning reported on a range of processes and structures that facilitate such linkage. Examples include processes and structures for assessment (2),¹¹⁹ planning (14)¹²⁰ and implementation (5).¹²¹ Several case studies addressing the four thematic areas discussed in chapters II.E–H also reported on good practices related to processes and structures for linking national and local adaptation planning (24 of those addressing ecosystems,¹²² 15 health,¹²³ 13 human settlements¹²⁴ and 15 water resources¹²⁵). The good practices and lessons learned discussed in this chapter are derived from all relevant case studies.

170. Linking national and local adaptation planning is particularly relevant and important for the following reasons:

(a) Climate change significantly affects people, especially those whose livelihood depends on natural resources. The health impacts of climate change on individuals and communities are determined at the local level by changes in local conditions and health behaviours as a result of available information. Resilience can be strategically built through good development policies and practices that take climate change into consideration and empower communities. For example, timely and improved access to climate-related information by local people (e.g. farmers) that helps them to plan agriculture systems which are resilient to climate change significantly depends on a decentralized system of national meteorological services;

(b) Climate-related hazards affect natural, social and economic functions of ecosystems and the communities that are part of these ecosystems. Future climate variability and change, and its associated uncertainty, as well as the interconnectedness of systems and sectors at different levels, provides a strong case for inclusive and flexible planning processes;

(c) Climate-induced hazards have different impacts on populations and the groups within them. Vulnerable groups, such as women, children, the elderly and indigenous people, are at significant risk. National planning processes should be responsive to the needs and capacities of vulnerable groups;

(d) A robust response to climate risks and impacts requires a strong link between national policies and planning, where many of the resources, expertise and personnel for risk management are concentrated, and local planning, where communities are forced to become first responders to impending hazards;

(e) The effectiveness of adaptation is highly context dependent. Without understanding the local context, national plans will not have the desired impact. If community members are more educated and aware of the issues and solutions related to climate change in their immediate ecosystem and the way it affects them specifically, they will be more likely and willing to participate in conserving the ecosystem and be more receptive to the implementation of projects in their communities.

2. Tools and methods

171. The case studies provide various examples of institutional frameworks and processes for planning, identifying and appraising options for adaptation as well as for implementing adaptation actions. The examples include plans and guidelines in support of decision-making on adaptation and mainstreaming climate change adaptation into development and sectoral policies and plans at different levels.

3. Good practices

172. Several good practices have emerged in regard to stakeholder engagement and various processes and structures that facilitate linking national and local adaptation planning.

173. Strengthening national and local institutional frameworks catalyses transformational change and helps to replicate good practices:

(a) The Local Adaptation Plans for Action (LAPAs) in Nepal comprises a plan and a set of prioritized adaptation interventions. Led by the Ministry of Science, Technology and Environment of Nepal, LAPAs have been implemented through institutional structures at different levels: district development committees (responsible for implementing and integrating adaptation into development and planning processes); line agencies (responsible for sectoral planning and providing resources and expertise to execute the LAPAs); and community user committees (responsible for fostering local ownership of adaptation interventions);¹²⁶

(b) The Local Governments and Climate Change Initiative in Cambodia is another example of a strengthened institutional framework at the local level. The initiative fostered the role of local governments in identifying practical ways to mainstream resilience to climate change into subnational planning and finance systems;¹²⁷

(c) The Korean Ministry of Environment supported local governments in developing local adaptation plans, at both the provincial and the community levels, through provision of guidelines, case studies, consultations and workshops.¹²⁸

¹²⁶ NepalL11.

¹²⁷ SwedenL07.

¹²⁸ KoreaL06.

174. **The provision of funding or direct access to funding facilitates the linkage of local and national adaptation planning.** The Country Adaptation Fund Model used in Kenya engaged vulnerable community members through adaptation planning committees in prioritizing resilience-building activities against predetermined criteria for funding. The inclusion of community members in the allocation process not only recognized the value of local knowledge and fostered local ownership, but also recognized the community institutions established as a part of this process as legitimate agents for development that engage constructively with county government structures and processes.¹²⁹

175. **Integrating climate change adaptation considerations into sectoral and development planning processes of local bodies and governments helps to strengthen the linkage between local and national adaptation planning.** The IUCN developed a Climate Change Gender Action Plan in Mozambique through a multisectoral and multi-stakeholder process that facilitated the identification of gender-sensitive adaptation actions at both national and local levels.¹³⁰

176. **Promoting co-production of knowledge through an inclusive, multidisciplinary and structured process provides a strong impetus to harmonize top-down and bottom-up approaches and such processes also enable consideration of the multisectoral dimension of climate change in adaptation actions:**

(a) The establishment of Climate Science Centers (CSCs) is an example of a successful government–university partnership from the United States. CSCs enable access to skills, expertise, facilities and other resources at both national and local levels. CSCs include a stakeholder advisory committee of federal, state and tribal partners, which provide guidance and input on key management issues and priority scientific needs. Large-scale issues (e.g. drought, migratory species) that cross regions or are national in scope are coordinated through multi-CSC partnership activities, forming a multi-tiered science programme;¹³¹

(b) The Cities of the Future was a collaborative effort between the Government of Norway and the 13 largest cities in that country. The programme, carried out from 2008 to 2014, was led by the Ministry of the Environment, the Ministry of Local Government and Regional Development, the Ministry of Petroleum and Energy and the Ministry of Transport and Communications together with the Norwegian Association of Local and Regional Authorities and the business sector. Representatives of the cities were engaged in capacity-building related to knowledge of climate change, future climate change impacts in Norway and in the 13 cities in particular, and how the cities could face these changes with adaptation measures. The Cities of the Future was an important driving force for climate change adaptation in Norway and helped to speed up the climate change adaptation planning process in other municipalities;¹³²

(c) The Global Framework for Climate Services adaptation programme was launched in Africa in 2012 as a partnership of climate service producers (i.e. national meteorological agencies) and users of climate information and services (i.e. priority sectors of agriculture, health and disaster risk reduction) to work together to improve the quality, quantity and use of climate and weather services in Malawi and the United Republic of Tanzania.¹³³ The programme serves to mobilize partners to implement the framework for climate services at the national level in order to improve cooperation, capacity and use of accessible and accurate climate services that can inform climate adaptation. In the health sector, where awareness of the link between climate and health was very low at the beginning of the programme, the initiative has significantly increased the dialogue between the meteorological agencies and the ministries of health in the target countries, allowing for improved use of climate information in health sector adaptation efforts in the future.

¹²⁹ KenyaL02

¹³⁰ IUCNL03.

¹³¹ USAL13.

¹³² NorwayL14.

¹³³ WMOL16.

177. **Knowledge-sharing and learning at all levels and across multiple sectors is conducive to informing adaptation planning processes at national and local levels.** The report *Klimatsäkrat Skåne* (Climate-proofed Scania) developed for Scania (Sweden) is a good example of an interdisciplinary initiative that synthesized climate change information tailored to the regional context. Developed through collaboration between academia and regional authorities, the report is currently being used to inform deliberations in local and regional decision-making processes related to climate change adaptation, mitigation and overall regional development.¹³⁴

178. In regard to **M&E**, a comprehensive framework that uses local indicators and can be aggregated to subnational and national levels could serve as an effective tool in assessing the overall aggregate impact of local actions at the national level, which can help to inform the evidence base. The Tracking Adaptation and Monitoring Development Framework in Kenya aggregated locally generated indicators to county and national levels for assessing overall impact.¹³⁵

4. Lessons learned and factors that influence success

179. Improving **institutional capacity at all levels** enables innovative and effective institutional frameworks critical to linking national and local adaptation planning.

180. It is essential to recognize and leverage **networks and partnerships** that already exist at all levels, to establish clear roles and responsibilities for the various governance levels (in particular local, subnational and national), and to set up flexible and well-coordinated institutional processes.

181. National governments need to strengthen efforts (including the allocation of resources) to **understand, share with communities and enhance knowledge on climate risks in order to support local level resilience to climate change.** Provincial and district government offices have a crucial role in bridging national policies and local implementation.

182. **Aligning activities in national and local processes** is a factor for success.

183. It is imperative to have **information and knowledge exchange** between all members of the community (including men, women and indigenous people), scientists and policymakers to inform the decision-making process and make it more inclusive.

184. Because climate change affects all members of society and can have complex and cascading impacts, it requires the concerted and coordinated efforts of both governmental and non-governmental actors to develop appropriate solutions. **Civil society networks and platforms** can strengthen the link between local and national level adaptation planning.

5. Challenges and possible ways to address them

185. **Capacity-building for effective adaptation planning and actions is necessary at all levels.** Chile, as part of its NAP, is planning capacity-building for public institutions and civil society to improve their understanding of climate change and how it will affect their personal lives and communities.

186. **A lack of existing structures or mechanisms at the national level could be a significant barrier to coordinating and scaling up local actions.** One of the main challenges faced in implementing climate service programmes by the World Meteorological Association is the lack of existing structures for coordinating efforts at the national level, compared with the well-established mechanisms for other sectors such as health. To ensure that these efforts achieve tangible results and lead to improved adaptive capacity there is a need for a more

¹³⁴ LundL04.

¹³⁵ KenyaL02.

coordinated approach. Making a clearer link between climate services and climate change adaptation, engaging with the process to formulate and implement NAPs, and working with existing structures for climate change coordination can help address this challenge.¹³⁶

187. The process to formulate and implement NAPs under the Cancun Adaptation Framework offers an important opportunity for countries to link national planning processes to local knowledge and experiences. However, specific guidance, measures and mechanisms are needed to link local experiences and national priority-setting processes.

J. Conclusions and next steps

188. Certain common elements have emerged on adaptation planning processes addressing ecosystems, human settlements, water resources and health, as well as on linking national and local adaptation planning. This chapter highlights these key common elements, including gaps in relation to the provision and dissemination of information and knowledge, which could be considered as a basis for possible next steps, in the context of the NWP.

189. The findings in chapter II.E–I provide evidence of the links between ecosystems – at the level of species, genetic diversity within species and ecological interactions – and water resources, health and human settlements, hence supporting the notion that adaptation planning and practices are often cross-thematic and yield benefits in more than one thematic area. For example, there was recognition in the case studies of the role that healthy ecosystems play in increasing the resilience of communities and helping people to adapt to climate change through the delivery of a wide variety of services that help maintain human well-being. Human settlements also show evidence on the link with other thematic areas, including water resources, environmental services and health.

190. In regard to the integration of gender-sensitive strategies and tools and of indigenous and traditional knowledge, the following key messages have emerged:

(a) It is important to develop and use information and knowledge from all sources, including co-constructing traditional, local and contemporary scientific sources, recognizing cultural and gender sensitivities, and ensuring that all such information is gathered and validated, if possible, through a systematic process. Such co-construction processes help empower local communities, promote shared understanding of the issues and strengthen the capacity of communities to implement adaptation actions;

(b) Inclusive processes that engage all members of a community (including men, women and indigenous people) often help secure ownership and develop and strengthen local institutional capacity to deliver results in meaningful and locally appropriate ways. Hence, it is imperative to have information and a knowledge exchange among all members of the community, scientists and policymakers to inform the decision-making process and make it more inclusive.

191. Although some case studies provided examples of good practices, a number of gaps and challenges exist in relation to the provision, documentation and dissemination of information and knowledge, including on collaborative partnerships at multiple levels, for scaling up adaptation actions addressing the four thematic areas referred to in paragraph 51 above. Knowledge and information issues that would be useful for adaptation practitioners and policymakers to consider in the light of these gaps and challenges are as follows:

(a) It is crucial to disseminate the scientific findings of the local impacts of climate change at the regional level. While producing good science is important, communicating the results is essential. Communication tools are crucial and need to be tailored to stakeholders and audiences;

¹³⁶ WMOL16.

(b) Documenting and disseminating information and knowledge at all levels and across multiple sectors is conducive to informing adaptation planning processes at national and local levels. Documenting and disseminating information and knowledge on the impacts of climate change addressing various themes, vulnerability and adaptation assessments, and adaptation plans and actions provides an important knowledge base and a helpful basis for scaling up and scaling out good practices;

(c) The co-production of knowledge (i.e. scientific, local and traditional knowledge) is effective only when supplemented with effective training, ongoing learning and communication of results and outcomes of adaptation projects and practices to the knowledge holders;

(d) Adaptation planning and actions that are flexible and reflect capacity and institutional structure at all levels have led to increased acceptance and increased ability of people to respond to changing needs. The flexibility and responsiveness can be best ascertained when adaptation plans and priorities use the evidence base of knowledge for current variability and future impacts, institutional arrangements, the sociopolitical context and capacity at different levels, and when there are mechanisms in place for regular review in the light of new knowledge, unexpected events and changes in capacity. For example, explaining the links between ecosystem and adaptation projects and national priorities, plans, programmes, strategies and policies, including the process to formulate and implement NAPs, is useful;

(e) The process to formulate and implement NAPs under the Cancun Adaptation Framework offers an important opportunity for countries to link national planning processes to local knowledge and experiences. However, specific guidance, measures and mechanisms are needed to link local experiences and national priority-setting processes;

(f) Clear measures of effectiveness disaggregated to demonstrate the impact on reducing the vulnerability of different groups, sectors and locations are essential. These measures are often hindered by a lack of clarity on how project goals and activities are linked to addressing vulnerability to specific climate hazards, trends and variability by managing ecosystems;

(g) There is a need to build understanding of the time required to obtain positive results in relation to adaptation goals of different adaptation approaches;

(h) Information used in assessing the replicability of adaptation approaches, such as the resources required, and more detailed information on the scale of the intervention and how this relates to the scale of the impacts is critical for effective adaptation planning and practices.

192. In addition to gaps with regards to the provision and dissemination of information and knowledge on good practices and lessons learned, the following actions are recommended in the light of gaps and challenges to scale up adaptation actions addressing these issues:

(a) Capacity-building activities and adequate national level coordination structures or mechanisms are essential factors for effectively linking national and local adaptation planning. The process to formulate and implement NAPs could provide a useful entry point through which to strengthen the capacity of public institutions and to facilitate coordination for adaptation planning and practices at different levels;

(b) Enhancing the technical capacity to analyse risks and planning for effective adaptation are critically important and effective technological solutions;

(c) In addition to adequate financial resources and financial instruments, a flexible and decentralized funding structure is also critical. Such a structure will provide local and vulnerable communities with the ability to determine how best to use the financial resources made available to them from higher level authorities for scaling up adaptation planning and practices;

(d) Political will, local institutional set-up (or local ownership) and financial commitment among countries sharing the transboundary water resources can be crucial to ensure successful coordinated action to reduce vulnerability of such transboundary water resources. Time investment, which is often crucial in building collaborative partnerships to manage water resources, will be also crucial in this regard.

193. An effective M&E mechanism is also an integral part of the adaptation planning processes. The creation of this mechanism could include developing, among others, a phased approach to risk assessment; and an understanding of how to measure, attribute, put a time frame on (where impacts may take a long time to detect), cost, identify the impacts of, and build an evidence base. Ensuring adequate resources are dedicated to M&E; as well as developing indicators that cover context, impact and generate information that will address gaps in the evidence base; and including M&E from the start will help in this process.

Tools and methods referred to in the case studies

[Anglais seulement]

Table 6
Tools and methods referred to in the case studies addressing ecosystems

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
BirdLifeE18	BirdLife International secretariat	Combining participatory learning and action tools with BirdLife's toolkit for assessing ecosystem services (TESSA) ¹	TESSA engages local communities in the consultation and data collection, interpretation and verification process, helping the community to understand and communicate to decision makers their dependence on ecosystems and the implications of different land-use scenarios, as it did for example when used in Burundi as part of BirdLife's ecosystem conservation initiative in East Africa by the Serukubeze community. A customized toolkit results from the process	✓	✓	
BirdLifeE10	BirdLife International secretariat	Using Climate Resilient Altitudinal Gradients (CRAGs) ² to plan interventions in mountainous transboundary watersheds	CRAGs are multiscale landscape units with a minimum altitudinal range of 1,000 metres, characterized by climate resilient biodiversity and ecosystem service values. With the participation of key stakeholders and transboundary lake basin authorities, CRAGs are being used to create a spatially explicit plan of action for nine terrestrial and four freshwater key biodiversity areas at various altitudes			✓
BlueVenturesE42	Blue Ventures	Periodic fishing system	After first determining the necessary recovery period of a subsistence fishery, the fishing cycle is changed to a system			✓

¹ <<http://www.birdlife.org/worldwide/science/assessing-ecosystem-services-tessa>>.

² <http://www.birdlife.org/sites/default/files/attachments/CRAG-project_0.pdf>.

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
AERIE46	Amazon Environmental Research Institute	System of Observation and Monitoring of Indigenous Amazon (SOMAI) platform ³	of carefully balanced fishing and non-fishing periods. The implementation of this system has helped the Vezo people of southern Madagascar to improve both conservational outcomes and fish yields Through the use of historical data on climate anomalies and regional deforestation, SOMAI web-based platform provides a database capable of generating indicators for the indigenous people's land exposure to extreme climate events. The platform supports a consultation and monitoring system	✓	✓	
BrazilE07	Brazil	Dissemination of agroecological practices and techniques through the Mandacaru Capacity Building Center	The centre disseminates a wide range of agroecological practices and techniques and manages a school that not only educates children but promotes the participation of their parents in enhancing their understanding of these practices through meetings and activities. The development of social capital around the school has helped to build community trust in adopting new practices		✓	
CanadaE03	Canada	No-tillage agricultural technologies and systems	No-till farming reduces the impacts of climate change and helps to build soil carbon and quality, improve nutrient balance and improve water conservation while reducing the need to disturb the soil. A study in Alberta found that the method was one of the few strategies farmers were able to implement to adapt to climate change. A database of farmers, equipment, and soil and crop types was developed so that new farmers could contact someone with the same agricultural circumstances for focused learning by experience		✓	
CanadaE03	Canada	Inclusion of no-tillage questions in the Canadian national census	The inclusion of questions in the Canadian national census regarding uptake of no-till agriculture allowed the Government of Canada to measure progress in the utilization and uptake of no-till agricultural practices		✓	✓

³ <<http://ipam.org.br/ipam/folheto-somai-en>>.

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
CAREE26	CARE International	Participatory Monitoring, Evaluation, and Reflection and Learning (PMERL) ⁴ tool	The PMERL manual helps practitioners to measure, monitor and evaluate changes in local adaptive capacity for better decision-making in community-based adaptation activities. The approach provides an ongoing platform for local stakeholders to articulate their own needs and preferences beyond the lifetime of a project. During regular review and reflection meetings with communities, the PMERL tool was utilized to enable the discussion of progress on the achievements of the project in a participatory way before any changes required in the adaptation plan were made		✓	✓
CFIE44	Community Forests International	Community-based Risk Screening Tools – Adaptation and Livelihoods (CRiSTAL) tool ⁵	The CRiSTAL project-planning tool was used to conduct participatory risk and asset mapping for target communities. In Pemba, the process allowed further refinement of project activities in the form of scalable resilience adaptation toolkits – unique assemblages of appropriate technology activities tailored to each target community	✓		
CFIE44	Community Forests International	Custom top-down monitoring and evaluation (M&E) framework	The custom top-down M&E framework includes purpose-built software tools stratified into three separate but continuous levels of operation: (1) real-time data collection by project officers using an in-house FieldView project monitoring application based on FileMaker and GPS-enabled tablet technology; (2) data archiving, data set compilation and open source data sharing via a custom online Adaptation Database; and (3) evaluation of project impacts and identification of opportunities for refinement based on regular benchmarked internal reviews and third-party Results Oriented Monitoring			✓
ICIMODE39	International Centre for Integrated	Participatory Perspective Land use Planning	A Participatory Perspective Land use Planning approach, including facilitated community mapping and meetings, was used in North-east India to promote the practice of land		✓	

⁴ <<http://careclimatechange.org/tool-kits/pmerl>>.

⁵ <<https://www.iisd.org/cristaltool>>.

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
ILOE06	Mountain Development International Labour Organization	approach Innovative and integrated financial and risk transfer mechanisms	zonation, contributing to improved resource management and conservation of ecosystem services and livelihood security The model bundles and rolls out critical financial and non-financial services in an integrated financial package (IFP) to farmers who are more vulnerable to climate-related risks by their poverty and lack of access to financial and productive resources. The approach facilitated increased access to credit, savings facilities, and formal and informal insurance (crop, life, health), including the innovative Weather-Index-based Insurance Package. It further facilitated access to productive services, including agritechnology training (Farmer Fields School) and related agriculture support, enterprise and business training as well as market information and assistance. These services are delivered through the three models of the IFP: the Rural Bank model, the Cooperative model and the Local Government Unit Loan Facility model		✓	
ILOE25; ILOE45	International Labour Organization	Local resource-based approaches	Local resource-based approaches combine and optimize the use of local resources in the construction and maintenance of infrastructure and environmental works. The approach helps to generate employment in the short term and trigger a multiplier effect on the cash injected into local communities, supporting the local economy. Other benefits include capacity-building through training and local partnerships		✓	
IUCNE14	International Union for Conservation of Nature (IUCN)	Community Environment Conservations Fund (CECF) tool ⁶	The CECF tool acts as an enabling environment for communities to access microcredit and undertake activities that will improve their livelihoods in the short term while restoring and enhancing sustainable management of their water and natural resources in the long term. The CECF tool allows communities access to a USD 1,500 grant that simultaneously tackles poverty as a source		✓	

⁶ <http://www.uwasnet.org/Elgg/best_practice/view/6128/community-environment-conservation-fund-cecf-as-a-tool-to-catalyze-water-resources-management>; <http://cmsdata.iucn.org/downloads/cecf_guidelines_final_1.pdf>.

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
IUCNE15	IUCN	Community-based Ecological Mangrove Restoration (CBEMR) method	of environmental degradation and spurs sustainable water resources and ecosystems management. To qualify for the funds, households must adhere and commit to guidelines for implementing the village natural resources micro-catchment plan that has been mutually developed and agreed to The CBEMR method uses hydrological restoration to revive degraded areas. In this case study, the method allowed shrimp ponds to be returned to functioning, productive ecosystems that act as bioshields, increasing the resilience of vulnerable coastal communities. The communities are taught how to restore and sustain the underlying hydrology of former mangrove sites, boosting their biodiversity		✓	
IUCNE15; IUCNE38; IUCNE47	IUCN	Action Learning approach ⁷	The Action Learning approach is used in several IUCN projects to monitor and evaluate the project activities. Through a series of repeated cycles of action, observation, reflection, learning and planning, this process allows for learning from action, with insights and understanding that informs further action in a cyclical manner		✓	✓
IUCNE23	IUCN	Forest Landscape Restoration (FLR) strategy	The FLR strategy involves the following steps: (1) Define the FLR strategy: defining and adopting a strategy to align stakeholders in the restoration initiatives (governmental institutions, communities and private companies), while allowing the creation of an official road map for each country. This strategy is accompanied by a biophysical and economic evaluation in each country through the use of the Rapid Restoration Diagnostic and Restoration Opportunities Assessment Methodology (ROAM). (2) Identify pilot restoration areas: identifying the needs and opportunities of FLR actions in both communities and anchor companies (mining, hydropower, tourism, etc.) interested in improving		✓	✓

⁷ <<https://portals.iucn.org/library/sites/library/files/documents/2014-038.pdf#page=108>>; <www.sdfthai.org> (in Thai).

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
			the ecological integrity within a landscape gradient. (3) Monitor the extent of successful initiatives: monitoring is performed in terms of return on investment, social and natural capital, and capital of inspiration			
IUCNE23	IUCN	FLR strategy combined with ROAM ⁸	ROAM is a flexible and affordable framework for countries to rapidly identify and analyse FLR potential and locate specific areas of opportunity at national or subnational levels. These assessments help to highlight both the economic and the ecological opportunities that assisted and passive restoration can bring. The methodology is used in conjunction with the FLR strategy described above	✓		
IUCNE33	IUCN	Narrative approach to better understanding, assessment and planning ⁹	This narrative approach started with IUCN analysing climate hazards based on villagers' 'community climate story', analysing those hazards that historically affect the village, the ways in which crops and livelihoods are affected at different times of the year, and the strategies already in place to deal with these hazards. The project then presented the 'scientific climate story' on the findings of a Mekong-oriented study, a local vulnerability assessment, and both climate and non-climate factors that increase that community's vulnerability. Local communities then defined a community vision based on shared understanding of the two stories, which enabled them to identify short-, medium- and long-term activities to increase both community and ecosystem resilience	✓	✓	
IUCNE35	IUCN	Use of micro watersheds as the main units for zoning and planning ¹⁰	By applying the ecosystem and sustainable livelihoods approach, IUCN developed a model of community planning and water management with an emphasis on micro watersheds based on broad community participation and	✓	✓	

⁸ <<http://careclimatechange.org/tool-kits/pmerl>>.

⁹ <http://iucn.org/about/union/secretariat/offices/asia/asia_where_work/thailand/our_projects/usaid_mekong_arcc_thailand>.

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
			recognition of micro watersheds as the main land units for zoning and planning. The model was developed with the active involvement of local political authorities with responsibilities for environmental issues. An approach using watersheds as units of territorial planning, especially for integrated water resources management, helps to address, discuss, link and better understand cause and effect			
IUCNE47	IUCN	Community Vulnerability and Capacity Assessment tool	This tool was used by communities to identify the main threats they are facing because of climate change, as well as local adaptation strategies put in place to cope with those threats. The aim was to identify, reintroduce and scale up successful local adaptation strategies	✓	✓	
IUCNE05	IUCN	Climate Resilience Evaluation for Adaptation Through Empowerment (CREATE) tool ¹¹	CREATE provides a broad, flexible framework together with general guidelines and suggestions, allowing people to assess and analyse their vulnerability and capacity, identify adaptation options and begin the planning process. It is a step-by-step process that demystifies the adaptation assessment and planning process, making terms accessible, analysable and assessable. CREATE raises awareness, increases knowledge and develops capacity within the local groups, organizations and networks that represent the community and vulnerable groups	✓	✓	
KenyaE40	Kenya	Payment for Environmental Services (PES)	PES was used in Kenya as a viable financial mechanism for the payment for watershed services to deliver sustainable natural resource management. The scheme applies a voucher system, with vouchers redeemable with agro-inputs at convenient and agreed-upon outlets. Benefits include increased farm productivity, increased income from different green businesses, qualitatively observed increase in water clarity, improved food security, and community acquired skills and knowledge on good land management practices to protect ecosystems			✓

¹¹ <https://cmsdata.iucn.org/downloads/create_factsheet_final.pdf>.

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
Nestlé E12	Nestlé	Agroforestry and reforestation to increase resilience of cash crops ¹²	The methodology focused on appropriate planting models and tree species for the regions to improve ecological and growing conditions and increase resilience against geophysical and biological threats to crops	✓	✓	
PracticalActionE31	Practical Action	Livelihood-Centred Disaster Risk Reduction ¹³	Livelihoods are strengthened and diversified to reverse the gradual erosion of capital and security that intensifies in the face of recurrent ‘small-scale’ disasters. Stakeholders are engaged through participatory baseline development and the creation and training of disaster management committees at ward, district and provincial levels	✓	✓	✓
RareE49	Rare	Implementation of Territorial Use Rights for Fisheries coupled with marine reserves (TURF-Reserve) ¹⁴	By combining TURF with marine reserves, Rare increases the capacity of local communities and fishers to manage access to near shore fisheries as well as conserve critical coastal habitat through marine protected areas. This model allows for the protection of key habitats where fish stocks can rebuild and generates a spill over effect that leads to improved catch in the adjacent fishing zones. Additionally, because of the value of assigned fishing rights within the TURF-Reserve, this system provides strong incentives to protect the fish recovery zone and sustainably manage the fishery			✓
SEIE52	Stockholm Environment Institute	Whole Decision-Network Analysis of Coastal Ecosystems (WD-NACE) ¹⁵	WD-NACE provides primary decision makers at multiple levels of governance with a framework to aid understanding of the critical social and ecological elements of resource use and the complex interrelationship between them. The first step involves finding what information people are using to make their decisions – the state of the environment, financial situations and community standing. The second step involves ‘coding’ the behaviour of the	✓	✓

WMO/GWPE30	World Meteorological Organization; Global Water Partnership	Integrated Drought Management Programme tools and guidelines ¹⁹	solutions to sustain vibrant, diverse ecosystems, such as by reducing greenhouse gas emissions, enhancing coastal ecosystem carbon sinks, reducing climate change impacts on wildlife and people, and enhancing resilience The programme supports stakeholders at all levels by providing policy and management guidance and by sharing scientific information, knowledge and best practices for integrated drought management. Under the programme, national drought management guidelines for the preparation of drought management plans within river basin management plans which are in accordance with the European Union water framework directive, a compendium of good practices and a drought information platform have been produced	✓	✓	
WWFE51	World Wide Fund for Nature	Top-down-meets-bottom-up approach climate vulnerability analysis for community-based climate change adaptation	The climate vulnerability analysis identifies priority interventions for community-based climate change interventions in the river basin and is based on projecting trends from historical climate data. In analysing the São João River basin in Brazil, the World Wide Fund for Nature's basin analysis was undertaken as a technical, top-down assessment, while the microbasin assessments involved bottom-up consultation with local communities to clarify likely risks and vulnerabilities	✓		
FS-UNEPE34	Frankfurt School – UNEP Collaborating Centre for Climate and Sustainable Energy Finance	Promotion and support of specific microfinance products and services to fund EBA ²⁰	The method assists in the development and implementation of new financial products and services tailored to rural populations vulnerable to the effects of climate change, provides customized capacity-building to microfinance institutions (MFI), and helps raise awareness and build capacity in MFI clients. In rural and periurban communities in Peru and Colombia to date, 2,300 disbursements targeting EBA investments have been realized by three partner MFIs, providing loans targeting EBA options			✓

Table 7
Tools and methods referred to in the case studies addressing human settlements

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
EEAHS08	European Environment Agency	Climate Atlas	The Climate Atlas provides standardized climate assessments for the 179 towns and municipalities in the Stuttgart region. The Atlas comprises maps that show regional wind patterns, flows of cold air, air pollution concentrations and other relevant information required to inform planners on what to do for urban climate optimization, which could inform new projects and retrofits. A key element is an area classification of the role that different locations play in air exchange and cool airflow in the Stuttgart region based on topography, development density and character, and provision of green space. The Atlas distinguishes eight categories of area in this manner, and different planning measures and recommendations are provided for each of them	✓		
ILOHS01	International Labour Organization	Learner-centred and participatory training approach	In this approach, modern, interactive adult learning methods are combined with training and knowledge-sharing elements. Throughout the training, emphasis is placed on partnerships at the local level and the effective use of local resources, with special attention given to regional and local experiences. The approach helped to increase local level capacity in both the public and the private sectors to integrate employment and livelihood concerns in local development strategies, programmes and business activities within the context of climate change adaptation, disaster risk reduction and crisis response		✓	
IUCNHS03; IUCNHS04; IUCNHS05; IUCNHS17; IUCNHS18;	International Union for Conservation of Nature (IUCN)	Method of Evaluation by Group Facilitation	The Method of Evaluation by Group Facilitation involves community members in the development of common knowledge and the production of solutions. The technique includes activities such as participative mapping, ‘kitchen assemblies’ and focus groups to co-construct knowledge.	✓		

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
IUCNHS26			It includes five steps: (1) collecting statements or opinions from participants; (2) developing a common understanding of these statements; (3) sorting the statements into groups of common themes; (4) prioritizing the statement groups; and (5) debating the results and evaluating the process. The method is often used in combination with the community resilience capacity-building tool outlined below. The results of the combination of these two components have included a greater understanding of climate change adaptation at the community level, the development of an adaptation plan that can be realistically achieved by the community, and a greater sense of ownership and engagement of the community in the climate change adaptation process			
IUCNHS03; IUCNHS04; IUCNHS05; IUCNHS17; IUCNHS18; IUCNHS26	IUCN	Community resilience capacity-building tool	Developed in order to help communities to initiate the process of adapting to climate change, the community resilience capacity-building tool helps communities to initiate the process of adapting to climate change. The tool itself provides a step-by-step explanation of the adaptation option with three sections: section 1 explains the process, section 2 describes how to assess risks and vulnerabilities looking at various aspects of social-ecological systems, and section 3 examines the way people can define solutions and strategies as well as how these solutions can be prioritized. The process itself is composed of 11 steps, which can be performed at a workshop over a few days or, most likely, given the limited availability of communities for a large block of time, through a series of meetings completed over a certain period of time. The tool is often used in combination with the Method of Evaluation by Group Facilitation described above. The results of the combination of these two components have included a greater understanding of climate change adaptation at the community level, the development of	✓	✓	

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
KoreaHS07	Republic of Korea	Vulnerability Assessment Tool to Build Climate Change Adaptation Plan (VESTAP)	<p>an adaptation plan that can be realistically achieved by the community, and a greater sense of ownership and engagement of the community in the climate change adaptation process</p> <p>The VESTAP platform includes the impact database and climate change variability assessment tool. Climate change impacts in this platform were classified according to the classification mechanics designed by the Intergovernmental Panel on Climate Change. Under these mechanics, units can be expanded to rural and metropolitan areas. The assessment results provide useful information that can also be used as spatial-temporal geographic information. The VESTAP results of all counties and communities in the Republic of Korea were visualized on the Internet browser platform, and these results will contribute to establishing a climate change adaptation master plan for central or community level local governments in 2015</p>	✓		
KoreaHS09	Republic of Korea	Climate Change Risk Assessment Tool (CCRAT) for the business sector	CCRAT has been developed to estimate the financial implications of the impacts of climate change on businesses in the Republic of Korea, using the financial statement and the balance sheet of each business. CCRAT is composed of a checklist for climate risk assessment, a semi-quantified risk assessment of climate change and suggested guidelines for adaptation. (1) The checklist for climate risk assessment evaluates how ready a business is for the risks climate change poses. Users can select a type of climate change risk and gauge its potential magnitude and probability. (2) The semi-quantified risk assessment uses Microsoft Excel software. The basic database includes prior probability distribution and climate risk probability: one shows how frequently damage that can be observed in the society occurs, while one is based on the regional climate projection	✓	✓	

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
			database provided by the Korea Meteorological Administration. (3) The suggested guidelines for adaptation in the business sector present a method to develop an adaptation strategy and action plan based on the CCRAT results			
NetherlandsHS28	Netherlands	Cyclic adaptive planning and decision-making pathways	The Delta Programme introduced cyclic adaptive planning (a step-by-step approach) and decision-making pathways in order to deal with climatological and socioeconomic uncertainties about the future. In this way, adaptive water management reduces the risk of unforeseen climate adaptation costs at a later stage as a result of inaction as well as the risk of investments in, for example, water infrastructure that later turned out not to be necessary (over investments). Adaptive water management is therefore a bridge between the 'no regret' principle and the 'precautionary principle' and provides flexibility for decision makers in water management and spatial planning	✓	✓	
NorwayHS02	Norway	The Climate Helper ²¹	To help bridge the gap between scientific understanding and municipal needs, the <i>Klimahjelperen</i> (The Climate Helper) was developed. The Climate Helper focuses on how municipalities can include climate adaptation in their daily tasks and the climate profile gives a short summary of knowledge on a region's climate challenges, expected changes and available information and data			✓
StudioNavaraHS21	StudioNavarra; GEOHAUS	German real estate valuation database	This database includes information on existing real estate purchasing prices, standard ground values and residential tables. Purchasing price data is based on data provided from the copies of each contract, leases and experts committees	✓	✓	

²¹ <<http://www.dsb.no/no/toppmeny/Publikasjoner/2015/Tema/Klimahjelperen>> (in Norwegian).

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
UNHabitatHS15	United Nations Human Settlements Programme	Gender-adapted 'exploratory walk' methodology	The Kampala Capital City Authority adapted the 'exploratory walk' methodology as advocated by United Nations Human Settlements Programme in a gender-sensitive area. Exploratory walks include: selecting suitable neighbourhoods; recruiting eight-member local groups (women only, men only and mixed sex groups); briefing the groups before separate sex and mixed sex group discussions; taking an exploratory walk to validate the findings; and discussing practical findings as separate sex then mixed sex groups. The exercise ends with a consensus-building session focusing on priorities for climate change adaptation. Gender-disaggregated data provided insights into respective interests and potential policy responses from the municipality. In Kampala for example, the walks resulted in women and men increasing their knowledge about urban gender dynamics in climate change. Men in particular came to appreciate that women's comparatively lower socioeconomic status made them more vulnerable to the effects of climate change and constrained their capacity to cope	✓	✓	
UNHabitatHS27	United Nations Human Settlements Programme (UN-Habitat)	Economic diversification training strategy	To help build community resilience to external shocks in communities vulnerable to climate change in Senegal, UN-Habitat project partners established a small industrial facility at the project site and provided hands-on training to about 100 residents on producing prefabricated housing modules that had been carefully adapted to the local context. Artisans who learned new skills now have an additional or supplemental source of income on which to fall back. The project thus went beyond reducing exposure to the climate change impacts causing the residents' vulnerability, such as storm surges and sea level rise – it tackled some of the more fundamental root causes of vulnerability	✓	✓	

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
WFEOHS30; WFEOHS31	World Federation of Engineering Organizations	Public Infrastructure Engineering Vulnerability Committee (PIEVC) Engineering Protocol ²²	The PIEVC Engineering Protocol is designed to assess the climate risk and engineering vulnerability of civil infrastructure (including buildings) to the impacts of climate change. The protocol systematically reviews historical climate information and projects the nature, severity and probability of future climate changes and events with the adaptive capacity of an individual infrastructure as determined by its design, operation and maintenance. It enables the identification of components at higher risk and the nature of the threat from the climate change impact. This information can be used to make informed decisions on what components require adaptation as well as how to adapt them; for example, design adjustments, or changes to operational or maintenance procedures	✓

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
WHO/UNDPH05; WHO/UNDPH06; WHO/UNDPH07; WHO/UNDPH08; WHO/UNDPH09; WHO/UNDPH15	World Health Organization (WHO); United Nations Development Programme	Climate change adaptation to protect human health methodology	vulnerable populations, workers' health and communication The WHO methodology aims to increase the adaptive capacity of national health system institutions, including field practitioners, to respond to climate-sensitive health risks. Under this methodology, the main health-related vulnerabilities to climate variability and change for the country are defined (e.g. diseases associated with water scarcity, storms and floods, changing climatic patterns, malnutrition) before the country's current health policies are examined to determine how the country is already addressing the challenges. Then, strategies, policies and measures are identified to determine how to address these incremental risks posed by climate change. Following this process, the barriers to implementation of these strategies, policies and measures are defined, along with the incremental costs necessary. Based on this information, a proposal is designed to implement one or more of these actions in each country	✓	✓	
UNITARH11	United Nations Institute for Training and Research	Resource guide for advanced learning on understanding the climate change and health interface ²³	The resource guide provides access to key high-quality learning resources on climate change and health. It is designed to facilitate access to state-of-the-art materials and courses on climate change and health, drawn primarily from within the United Nations system. Written from the perspective of a learner, it considers the following topics: (1) health impacts of climate change; (2) health-related vulnerability and adaptation assessments; (3) early warning systems for health risks; (4) building resilience of the health system; (5) national strategies and action plans on health adaptation to climate change; (6) monitoring and evaluation of programmes on health adaptation to climate change; (7) engagement with other health-determining sectors; and (8) health co-benefits of mitigation and adaptation policies and programmes		✓	✓
USAH02	United States of America	Building Resilience Against Climate	The BRACE framework allows health officials to develop strategies and programmes to help communities to prepare for the		✓	✓

<i>Case study code</i>	<i>Organization or Party</i>	<i>Tools and methods</i>	<i>Description</i>	<i>Vulnerability and assessment</i>	<i>Planning and implementation</i>	<i>Monitoring and evaluation</i>
WHO03	WHO	Effects (BRACE) framework ²⁴ Health-National Adaptation Plan (H-NAP) guidance	health effects of climate change. Part of this effort involves incorporating complex atmospheric data and both short and long range climate projections into public health planning and response activities. Combining atmospheric data and projections with epidemiologic analysis allows health officials to more effectively anticipate, prepare for and respond to a range of climate sensitive health impacts. Five sequential steps comprise the BRACE framework: (1) anticipate climate impacts and assess vulnerabilities; (2) project the disease burden; (3) assess public health interventions; (4) develop and implement a climate and health adaptation plan; and (5) evaluate impact and improve the quality of activities The H-NAPs of WHO provide guidance on protecting health from climate change through health adaptation planning. An addition to the technical guidelines for the NAP process ²⁵ on needs and specificities for the health sector, it has the same components and similar steps as the ones recommended for the overall NAP process. (1) Lay the groundwork: align the health adaptation planning process with the national process for developing a NAP and take stock of available information. (2) Prepare: conduct a health vulnerability and adaptation assessment, review implications of climate change on health-related development goals, legislation, strategies, policies and plans, and develop a national health adaptation strategy that identifies priority options. (3) Implement strategies: develop an implementation strategy for operationalizing H-NAPs and integrating climate change adaptation into health-related planning processes at all levels, and promote coordination and synergy with the NAP process, particularly with sectors that can affect health, and with multilateral environmental agreements. (4) Report, monitor and review: monitor and review the H-NAP, update the health components of the NAPs in an iterative	✓	✓	✓

OCW34	Ouranos Consortium	Participative approach to the identification and development of adaptation options	<p>saline groundwater. This is achieved by placing drainage pipes deeper and closer to each other compared with conventional drainage designs</p> <p>A participative approach to the identification and development of adaptation options is used as part of a multidisciplinary and integrated approach to developing adaptation strategies. The process of the participative approach was designed to facilitate the transfer of multiple types and sources of information (socioeconomic, environmental, technical and scientific) to policy advisors and decision makers. Following a workshop at the outset of the project to evaluate the vulnerability of coastal communities in eastern Québec to the impacts of climate change, user committees were formed to discuss, assess and choose adaptation solutions. This continuous transfer of knowledge and discussion with the project's scientific team led to the implementation of numerous adaptation actions and helped to increase the dynamic and holistic comprehension of the coastline, but more significantly it enabled discussions around the real issues of coastal management so that relevant and feasible adaptation options could be implemented</p>	✓	✓	
OCW35	Ouranos Consortium	Freedom space for rivers ³²	<p>This project explores the application of a hydrogeomorphological approach to the identification of potential flooding of the rivers in question in order to better understand how more frequent floods and periods of severe low water levels could pose a threat to public safety and alter the condition of river ecosystems. Using the hydrogeomorphological approach, the 'freedom space' of three rivers was determined by analysing historical photographs, digital elevation models and field observations. Numerical simulations were used to estimate the impact of climate change on the shift and potential flooding of the rivers, the floodplain and</p>	✓	✓

	operation in Europe; United States Army Corps of Engineers; United States Army Engineer Institute for Water Resources; Alliance for Global Water Adaptation		water management plan for the Dniester River basin that accounts for energy, environmental, agricultural, municipal water supply and flood risk management needs			
USAW20	United States of America	National Integrated Drought Information System (NIDIS) ³⁴	The NIDIS Act prescribes an inter-agency approach for drought monitoring, forecasting and early warning. NIDIS is envisioned to be a dynamic and accessible drought risk information system that provides users with the capacity to determine the potential impacts of drought and the decision support tools needed to better prepare for and mitigate the effects of drought. Its main objective is to increase the number of States and institutions with improved capacity to inform risk management and reduce exposure to drought and flood risks. NIDIS works through a system of coordination that involves scientists working in physical, natural and social sciences, water resources professionals across scales of decisions and actions, and preparedness communities in regions across the United States. As a result of the programme, fire season professionals have improved information to prepare for real conditions, water managers have access to early warning information, water utilities managers are able to update plans for allocation and flood control, the fallow lands project helped to identify emerging food shortages in vulnerable communities, and improved monitoring has contributed to the efforts of tribal communities to improve conservation and land management		✓

VeoliaW17	Veolia Environmental Services	STAR Utility Solution ^{TM35}	In Copenhagen, the STAR Utility Solution was used with the aim of implementing an effective adaptation strategy capable of forecasting flooding via advanced control and warning systems. There are two main components to this strategy. The first is an early warning system able to forecast floods six to twelve hours before they occur. Based on real-time control and on forecasting, the intelligent software continuously provides optimal operating conditions and maximizes the value of existing systems. Second, the software aims to optimize existing wastewater treatment plants and sewer network control systems by online control and overview of such plants and networks. As a result of the system, the number of all combined sewage overflows was reduced by 90 per cent, allowing a 93 per cent cost reduction compared with an investment in traditional storage capacity		✓	
WMO/GWPW08	World Meteorological Organization; Global Water Partnership	HelpDesk on Integrated Flood Management (IFM) ³⁶	Stakeholders can directly access the World Meteorological Organization/Global Water Partnership Associated Programme on Flood Management (APFM) resources through its HelpDesk on IFM, a platform acting as a hub for information exchange on flood management, supported by the APFM Technical Support Unit and its network of Support Base partners		✓	
WWFW48	World Wide Fund for Nature	Better Cotton Initiative chain of custody process ³⁷	The Better Cotton Initiative has a chain of custody process to ensure that the cotton grown can be traced from field to shop, generating trust from buyers and enabling statistics to be collected on uptake of better production processes		✓

IUCNL03	International Union for Conservation of Nature	Climate Change Gender Action Plan (ccGAP) ³⁸	The ccGAP identifies priority climate change concerns from a gender perspective and maps key actions at national and local levels. The plan focuses on key sectors, including, but not limited to, water, agriculture, health, mitigation (including energy and forests), disaster risk reduction and coastal management. The process is multi-stakeholder and multisectoral – often representing the first time technical staff of different ministries (e.g. water, energy, women’s affairs) have a chance to build mutual capacity on key issues related to gender and climate change. The engagement of donors and a wide range of stakeholders is also key, especially women’s organizations and networks both versed in and new to climate change, which offer on-the-ground realities and context to policymaking as well as innovative ideas for action, often building on already occurring projects. An outcome of the ccGAP process has been the identification of innovative activities through which women can be engaged proactively, empowered as partners and promoted as agents of change	✓		
KoreaL12	Republic of Korea	Guidebook to develop a project supporting people vulnerable to extreme weather	The guidebook: (1) defines and explains the group vulnerable to extreme weather; (2) introduces quantitative analysis methods, which are practical in formulating detailed action plans; (3) introduces actions local governments have taken for groups vulnerable to extreme weather, using quantitative analysis; and (4) provides feasible actions to support the group vulnerable to extreme weather in a practical way	✓	✓	
NepalL11	Nepal	Local Adaptation Plans for Action (LAPAs)	LAPAs are tools that use a set of processes to address the impacts of climate change and to enhance the resilience of communities vulnerable to climate change. LAPAs provide prioritized adaptation interventions planned by local communities for a three-		✓	✓

CATIEL09	Tropical Agricultural Research and Higher Education Center	Methodology for the design of local strategies for climate change adaptation (ELACC)	<p>year period. The key principle of LAPAs is to mainstream climate change adaptation into regular planning processes. The Nepal Climate Change Support Program does this through coinciding the planning process for LAPAs with the district level regular planning process</p> <p>ELACC is carried out with a participatory focus in three stages: (1) territory analysis: identifying the platform for participation (all local stakeholders), the work area, local livelihoods, resources and capital, and basic human needs; (2) vulnerability analysis: based on exposition, sensitivity and adaptive capacity; (3) designing the ELACC: based on the territory vision, strategic objectives with criteria for success and strategic lines of action</p>	✓	✓	
UNESCWAL15	United Nations Economic and Social Commission for Western Asia	Regional Initiative for the Assessment of the Impact of Climate Change on Water Resources and Socio-Economic Vulnerability in the Arab Region (RICCAR) ³⁹	<p>RICCAR has four pillars: (1) a baseline review; (2) an integrated assessment consisting of an impact assessment and a vulnerability assessment; (3) awareness raising and information dissemination; and (4) capacity-building and institutional strengthening. A vulnerability assessment methodology was developed and about 50 indicators for key sectors were identified, mainly for water, agriculture, biodiversity and ecosystems, infrastructure and human settlements, and people. This work included a review of more than 50 socioeconomic and environmental indicators that have been defined to characterize exposure, sensitivity and adaptive capacity related to these five sectors, as well as generation of selected maps to geospatially represent this information for the Arab region</p>	✓		
SwedenL07	Sweden; United Nations Capital Development Fund	Performance-based climate resilient grants (PBCRGs)	<p>The PBCRG approach facilitates the mainstreaming of climate change adaptation into local development plans, supporting the implementation of national level climate change and decentralization strategies. There is evidence that the approach strengthens the capacity of local authorities to identify, prioritize and co-finance climate change adaptation investments. PBCRGs include a set of minimum conditions, performance measure criteria</p>		✓	✓

UNDPL05	United Nations Development Programme	Systematic disaster risk management planning process	<p>and a menu of investments. Minimum conditions are concerned with public financial management and good governance. Each PBGRG provides an entry point for monitoring and evaluation and to inform future planning processes</p> <p>The process began with a hazard, vulnerability and risk assessment in the project communities, followed by the preparation of a contingency/disaster management plan at the village level, which helped to identify the at-risk populations and assets in the village. The plan suggested measures to enhance disaster response capabilities and also recommended easy-to-implement, low-cost community-centric risk mitigation measures. Specific structural and/or non-structural mitigation measures were then implemented in the project villages, with community involvement</p>		✓
